DESCRIPTION
The MP8040 is a general purpose, high frequency half bridge power driver capable of driving a 9A load. The device integrates both top and bottom N-Channel MOSFET power switches and is fully protected from both sourcing and sinking current by a preset cycle-by-cycle current limit. It has a wide input voltage range from 7.5V to 25V.

The MP8040 features a low-current shutdown mode, input under-voltage protection, thermal shutdown, and fault flag signal output. It interfaces with standard logic signals and is available in a small 8-pin SOIC with exposed pad package.

FEATURES
- ±9A Peak Current Output
- ±4.25A Continuous Current Output
- Up to 1.2MHz Switching Frequency
- Protected Integrated Power 100mΩ Switches
- All Switches Current Limited
- Integrated Under-Voltage Protection
- Integrated Thermal Protection
- 2.5µA Standby Mode
- True 2-Quadrant Operation
- Sources and Sinks Current
- Fault Indicator Output

APPLICATIONS
- Class D Audio Driver
  - 25W/4Ω/10% Output Power Single Ended
  - 70W/4Ω/10% Output Power Full Bridge
- Full or Half Bridge DC-DC Switching Regulator
- Motor Driver

  For Lead Free, add suffix –LF (eg. MP8040DN–LF–Z)

ABSOLUTE MAXIMUM RATINGS (1)

- SP Supply Voltage ($V_{SP}$) .................. 28V
- SW Pin Voltage .................................. –0.3V to $V_{SP}$
- SW to BS ..................................... –0.3V to +6V
- Voltage at All Other Pins ................. –0.3V to +6V
- Storage Temperature ......................... –55°C to +150°C

Recommended Operating Conditions (2)

- SP Supply Voltage ($V_{SP}$) ................. 7.5V to 24V
- Peak Output Current .......................... 9A
- Peak Operating Temperature .................. –40°C to +85°C

Thermal Resistance (3) \( \theta_{JA} \quad \theta_{JC} \)

SOIC8N .................................. 50 ....... 8 .... °C/W

Notes:
1) Exceeding these ratings may damage the device.
2) The device is not guaranteed to function outside of its operating conditions.
3) Measured on approximately 1” square of 1 oz copper.

ELECTRICAL CHARACTERISTICS

$V_{SP} = 12V, V_{SHDN} = 0V, T_A = +25°C$, unless otherwise noted.

</tbody>
</table>

OPERATION

The MP8040 is a general purpose, power driver. It takes a logic input and drives a half bridge comprised of 0.1Ω high-side and low-side N-Channel MOSFET switches. It operates at frequencies up to 1.2MHz, can accept a DC supply voltage as high as 25V, and produce peak output current as high as 9A.

![Figure 1—Function Block Diagram](image_url)
**SW Output**
The SW output drives the load. It is controlled by the logic input signal at PWM. When the signal at PWM is high (above 2V), the high-side switch is turned on. When the signal at PWM is low (less than 0.4V), the low-side switch is turned on.

The MP8040 uses internal N-Channel MOSFETs for both the high-side and low-side switches. The high-side MOSFET gate drive is powered from the voltage between SW and BS, allowing BS to rise above the SP input voltage to power the high-side MOSFET. To do this a bootstrap capacitor is connected between SW and BS. When the low-side switch is on, the capacitor is internally charged from the voltage at DRV, which is also internally generated. There is a dead time region (typically 40ns) where both the upper and lower switches are off (see Figure 2).

Both the high-side and low-side switches have internal current limits to prevent failure due to excessive load current. Once the current limit is reached, both output switches are turned off and the fault output is asserted (driven low).

**Shutdown**
The MP8040 includes a 2.5μA shutdown mode. When SHDN is high, both output switches are turned off and the input current drops to 2.5μA. When the MP8040 is shutdown, the internally generated voltage at DRV drops to 0V, and the fault output (FLT) is asserted (driven low). If the shutdown mode is not used, connect SHDN directly to GND.

**Fault Output**
The MP8040 includes a fault indicator output (FLT). This is an active-low open drain output. The MP8040 detects faults due to over-current (>9A), over-temperature (>160°C), under-voltage at SP (<6.5V), or if the part is disabled. Connect FLT to DRV or to an external voltage up to 6V through a 27kΩ or greater resistor. When any of the 3 fault conditions are detected, both output switches are turned off and the SW output is high-impedance.

**Thermal Shutdown**
The MP8040 includes a thermal overload protection circuit. If the die temperature rises above 160°C, the output switches are turned off and the fault output is asserted. Once the thermal overload circuit is tripped, the die temperature must drop below 140°C before automatically restarting.
