EV4570-F-01A

3A, 55V, Frequency Programmable Step-Down Converter

The Future of Analog IC Technology

DESCRIPTION

The EV4570-F-01A is an evaluation board for the MP4570/MPQ4570, a frequency programmable step-down switching converter with integrated internal high-side and low side power MOSFETs. It can provide 3A continuous output current with peak current control for excellent transient response and efficiency performance.

The wide 4.5V to 55V input voltage range accommodates a variety of step down applications, including those applications in industrial, PoE, automotive and printer with DC high voltage bus.

The valley current detection is used to avoid current running way at over current protection. Also it has accurate and reliable over voltage protection, and auto recovery thermal protection. In addition, the optional external soft start is available. Enable and power good indication function can be used to power track easily. In order to increase the efficiency, MP4570/MPQ4570 will automatically scaling down the switching frequency when load is light. Meanwhile, the low side MOSFET will be turned off to reduce driver loss when zero inductor current is detected. Synchronous operation mode with integrated low side MOSFET is much helpful to reduce the conduction loss and also beneficial to reduce external components space and save the cost.

The MP4570/MPQ4570 is available in a TSSOP-20 EP with exposed pad package.

ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	V_{IN}	4.5-55	V
Output Voltage	V_{OUT}	3.3	V
Output Current	I_{OUT}	3	A

FEATURES

- Wide Input Voltage Range: 4.5V to 55V
- Programmable Switching Frequency
- Stable Independent on Output Capacitors
- Optional External Soft Start
- Peak Current Mode Control
- OCP Protection with Valley Current Detection
- Support External SYNC Clock
- OVP Protection
- Current Limit Decreasing during Output Short for Better Thermal Performance
- Power Good Indication
- Thermal Shutdown Protection
- Fully Assembled and Tested

APPLICATIONS

- PoE Input Non-isolated Buck
- Industrial Power Systems
- Printers and Scanners
- Automotive Power Systems
- Distributed Power Systems

All MPS parts are lead-free, halogen free, and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

QUICK START GUIDE

1. Connect the positive and negative terminals of the load to the VOUT and GND pins respectively.
2. Preset the power supply output to between 4.5V to 55V, and then turn it off.
3. Connect the positive and negative terminals of the power supply output to the VIN and GND pins respectively.
4. Turn the power supply on. The MP4570/MPQ4570GF will automatically startup.
5. To use the Enable function, apply a digital input to the EN pin. Drive EN higher than 1.6V to turn on the regulator, drive EN less than 1.3V to turn it off. There is no internal pull-up or pull-down circuit, so do not float this pin.
6. Connection the EN pin directly to a voltage source without any pull-up resistors requires limiting voltage amplitude to ≤6V to prevent damage to the internal zener diode between EN and GND; EN pin can also be connected to higher voltage (e.g. VIN) through pull-up resistor, but need to make sure the pull-up reisistor is high enough to make sure the sink current into EN pin less than 150μA to avoid damaging the zener diode. For example, when connecting EN to V_{IN}=12V, $R_{pull-up}$≥ (12V – 6.5V) ÷ 150μA = 37kΩ.
7. Use R10 to re-program switching frequency if needed. The recommended R_{FREQ} values for various f_{sw} please see Table 1.

Table 1 — f_{SW} vs. R_{FREQ}

f_{SW} (kHz)	R_{FREQ} (kΩ)
1000	47.5
900	56
800	63.4
700	73.2
600	84.5
500	102
400	133
300	178
200	261
100	523

8. Use R1 and R2 to set the output voltage with V_{FB}=1V. For R1=10kΩ, R2 can be determined by:

$$R2 = \frac{10}{V_{OUT} - 1} k\Omega$$

Follow the Application Information section in the device datasheet to recalculate the compensation, inductor and output capacitor values when output voltage is changed.
