

DESCRIPTION

EV3908+8002-00A is designed as the Power over Ethernet (PoE) Powered Device (PD) module. An RJ-45 connector is provided to connect directly to an Ethernet cable having a Power Sourcing Equipment (PSE) driving it on the other end. It also accepts power applied using a stand-alone power supply.

According to the IEEE 802.3at specification, the PD module must provide the circuitry needed to be detected by the PSE as it polls the Ethernet links. The IEEE 802.3at specification also allows the option for the PD to provide classification as to the amount of power needed by the PD Module. EV3908+8002-00A with the MP8002DN provides all the necessary hardware to provide detection and classification together with programmable inrush current limit, power good indicator, thermal protection and current limit. An external 30W Flyback converter is connected as the PWM part of the PD, which is controller by the synchronous PWM controller MP3908DS with soft-start, slope compensation and peak current limiting.

FEATURES

- Meets IEEE 802.3at Specifications
- 100V, 0.8Ω Integrate DMOS Device in MP8002DN
- 450mA, Temperature Compensated Current Limit
- Open Drain Power Good Output
- Synchronous Rectification for MP3908
- Current Mode Control
- Soft-Start
- 250kHz Constant Frequency Operation

APPLICATIONS

- VoIP Telephones
- Network Cards
- Security Camera Systems
- Safety Backup Power
- Remote Internet Power

ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	V _{IN}	40 – 57	V
Output Voltage	V _{OUT}	5	V
Output Current	I _{OUT}	0-6	A

"MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

QUICK START GUIDE

1. Connect the load between VOUT (positive) and GND (negative) terminals.
2. Plug the cable coming from the PSE, carrying the input voltage for the PD, into the Ethernet Jack J1. The board will automatically startup.
3. External DC supply can also be used. Preset the power supply output to 40V – 57V and turn off the power supply. Connect the positive terminal of the power supply output to the VDD pin and the negative terminal of the power supply output to the VSS pin. Turn the power supply on. The board will automatically startup.
