

## DESCRIPTION

The EV1584EN-00A is an evaluation board for the MP1584, a high frequency step-down regulator with an integrated power MOSFET.

The MP1584 integrates a 150mΩ MOSFET that provides 3A load current over a wide operating input voltage of 4.5V to 28V.

Current mode control provides fast transient response and eases loop stabilization. An internal soft-start prevents inrush current at turn-on.

The EV1584EN-00A is a fully assembled and tested PCB. It generates a +3.3V output voltage at load current up to 3A from an 8V to 28V input range. Switching frequency is set at 500KHz.

## ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	$V_{IN}$	8 – 28	V
Output Voltage	$V_{OUT}$	3.3	V
Output Current	$I_{OUT}$	3	A

## FEATURES

- 3A Output Current
- Wide 8V to 28V Operating Input Range
- Adjustable Output from 0.8V to 25V
- Programmable Switching Frequency up to 1.5MHz

## APPLICATIONS

- Game Machines
- Automotive Systems
- Industrial Power Systems
- Distributed Power Systems
- Printer Systems
- Battery Powered Systems

"MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

## EV1584EN-00A EVALUATION BOARD

## QUICK START GUIDE

1. Connect the positive and negative terminals of the load to the VOUT and GND pins, respectively.
2. Preset the power supply output to between 8V and 28V, then turn it off.
3. Connect the positive and negative terminals of the power supply output to the VIN and GND pins, respectively.
4. Turn the power supply on. The EV1584EN will automatically startup.
5. To use the Enable function, apply a digital input to the EN pin. Drive EN higher than 1.6V to turn on the regulator, drive EN less than 1.2V to turn it off.
6. An input under voltage lockout (UVLO) function is implemented by the addition of a resistor divider R1 and R2. The EN threshold is 1.2V (falling edge), so  $V_{IN}$  UVLO falling threshold is  $1.2V \times \left(1 + \frac{R2}{R1}\right)$ . It is preset to 6V on this board.
7. Use R4 and R6 to set the output voltage with  $V_{FB} = 0.8V$ . For  $R4 = 40.2k\Omega$ , R6 can be determined by:  $R6 = 50.25 \times (V_{OUT} - 0.8)(k\Omega)$ . Follow the Application Information section in the device datasheet to recalculate the compensation, inductor and output capacitor values when output voltage is changed.
