

DESCRIPTION

The MP2227 is an internally compensated 1.6MHz fixed frequency PWM synchronous step-down regulator. MP2227 operates from a 3.3V to 24V input and generates an adjustable output voltage from 0.8V to 0.9xV_{IN} at up to 3A load current.

The MP2227 integrates a 160mΩ high-side switch and an 80mΩ synchronous rectifier for high efficiency without an external Schottky diode. With peak current mode control and internal compensation, it is stable with an output ceramic capacitor and a small inductor.

Fault protection includes hiccup short-circuit protection, cycle-by-cycle current limiting and thermal shutdown. Other features include frequency synchronization and soft-start.

The MP2227 is available in a small 3mm x 3mm 10-lead QFN package.

ELECTRICAL SPECIFICATION

Parameter	Symbol	Value	Units
Input Voltage	V _{IN}	4.5 - 24	V
Output Voltage	V _{OUT}	1.8	V
Output Current	I _{LOAD}	0 - 3	A

FEATURES

- 3A Output Current
- Input Supply Range: 3.3V to 24V
- 160mΩ high-side, 80mΩ low-side Internal Power MOSFET Switches
- All Ceramic Output Capacitors Design
- Up to 95% Efficiency
- 1.6MHz Fixed Switching Frequency
- Adjustable Output from 0.8V to 0.9xV_{IN}
- Internal LDO for Vcc supply
- 1MHz to 2MHz Frequency synchronization Input
- POK
- Hiccup Short Circuit Protection
- Thermal Shutdown

APPLICATIONS

- UP/ASIC/FPGA Core & I/O Supplies
- Printers and LCD TVs
- Network and Telecom Equipment
- Point of Load Regulators

QUICK START GUIDE

1. The output voltage of this board is set to 1.8V. The board layout accommodates most commonly used inductors and output capacitors.
2. Attach the positive and negative ends of the load to the V_{OUT} and GND pins, respectively.
3. Attach the input voltage ($4V \leq V_{IN} \leq 24V$) and input ground to the IN and GND pins, respectively.
4. The MP2227 will startup automatically without applying an external voltage to the EN pin. The output voltage V_{OUT} can be changed by varying R2. Calculate the new value using the formula:

$$R2=R1 \times (V_{FB}/V_{OUT}-V_{FB})$$

Where the $V_{FB}=0.8V$ and $R1=402k\Omega$ then the $R2=316k$ for 1.8V output voltage.
