# EV2452DD-00A

## 1A, 1MHz, 36V Step-Down Converter Evaluation Board

### DESCRIPTION

The EV2452DD-00A is an evaluation board for the MP2452, a high frequency (1MHz) step-down regulator with an integrated power MOSFET.

The MP2452 integrates a 500mΩ MOSFET that provides 1A load current over a wide operating input voltage of 3.3V to 36V.

Current mode control provides fast transient response and reliable over current protection. An internal soft-start prevents inrush current at turn-on.

The EV2452DD-00A is a fully assembled and tested PCB. It generates a +3.3V output voltage at load current up to 1A from an 8V to 36V input range.

### FEATURES

- 1A Output Current
- 1MHz Fixed Switching Frequency
- Wide 8V to 36V Operating Input Range
- Adjustable Output from 0.8V to 33V

### APPLICATIONS

- High Voltage Power Conversion
- Automotive Systems
- Industrial Power Systems
- Distributed Power Systems
- Battery Powered Systems

"MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

### ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	$V_{IN}$	8-36	V
Output Voltage	$V_{OUT}$	3.3	V
Output Current	$I_{OUT}$	0-1	A

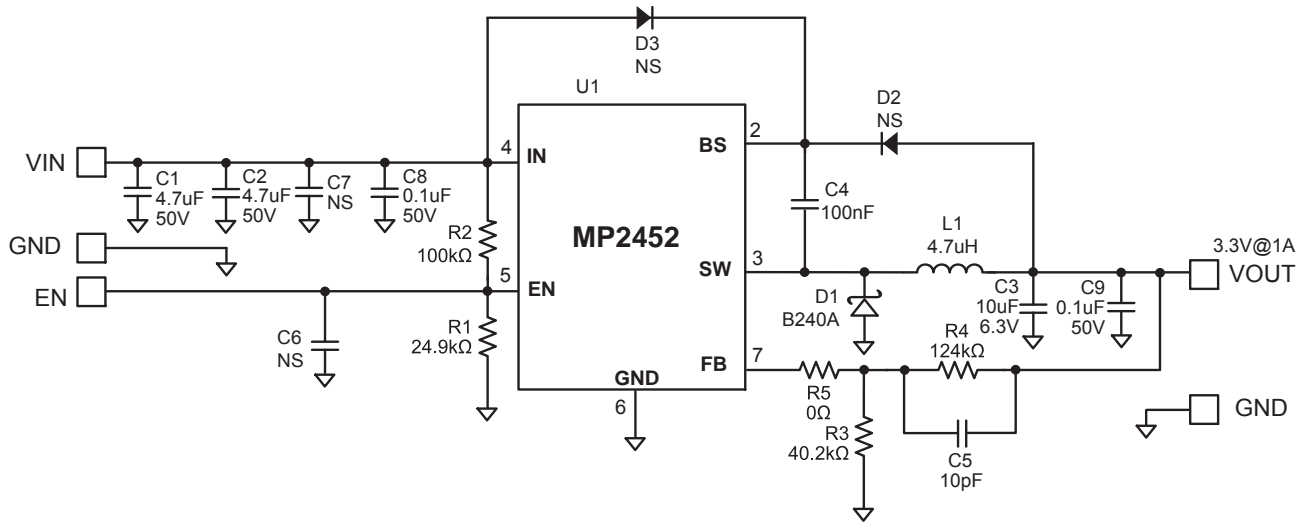

### EV2452DD-00A EVALUATION BOARD

(L x W x H) 2.5" x 2.5" x 0.4"  
6.35cm x 6.35cm x 1.0cm

Board Number	MPS IC Number

## QUICK START GUIDE

1. Connect the positive terminal of the load to VOUT pin, and the negative terminal of the load to GND pin.
2. Preset the power supply output to 12V and turn off the power supply.
3. Connect the positive terminal of the power supply output to the VIN pin and the negative terminal of the power supply output to the GND pin.
4. Turn on the power supply. The EV2452DD will automatically start up.
5. To use the Enable function, apply a digital input to the EN pin. Drive EN higher than 1.6V to turn on the regulator or less than 1.2V to turn it off. Note that floating the EN pin will turn it off.
6. An input under-voltage lockout (UVLO) function is implemented by the addition of a resistor divider (R1 and R2). The EN threshold is 1.2V (falling edge), so the input UVLO threshold is:

$$UVLO = 1.2V \times \left(1 + \frac{R2}{R1}\right)$$

The UVLO threshold is preset to 6V on this board.

7. To adjust the output voltage, change the values of R3 and R4. Generally, Choose R4 around 124kΩ for optimal transient response. For  $V_{FB}=0.8V$ ,  $R4=124k\Omega$ , R3 can be determined by:

$$R1 = \frac{99.2k\Omega}{V_{OUT}-0.8V}$$

Please follow the application information on the MP2452 datasheet to recalculate/select compensation values, the inductor value and the output capacitor value if the output voltage needs to be reprogrammed.
