

## DESCRIPTION

The EV4031-S-00A Evaluation Board is designed to demonstrate the capabilities of MP4031. The MP4031 is a primary-side-control offline LED lighting controller which can achieve high power factor and accurate current for either Triac dimmable or analog dimmable LED lighting application. It works in boundary conduction mode for reducing the MOSFET and Diode switching losses.

The EV4031-S-00A is typically designed for either driving a 16W Triac dimmable LED bulb with 30V<sub>TYP</sub>, 530mA LED load at 108V-132VAC/60Hz or driving a 16W analog dimmable LED bulb with 30V<sub>TYP</sub>, 530mA LED load at 108-305VAC.

The EV4031-S-00A has an excellent efficiency, can pass 3kV surge test, and meets IEC61000-3-2 Class C harmonics and EN55015 conducted EMI requirements. It has multi-protection function as over-voltage protection, over-current protection, cycle by cycle current limit, etc.

## ELECTRICAL SPECIFICATION

| Parameter                       | Symbol           | Value      | Units |
|---------------------------------|------------------|------------|-------|
| Input Voltage (Triac dimmable)  | V <sub>IN</sub>  | 108 to 132 | VAC   |
| Input Voltage (Analog dimmable) |                  | 108 to 305 | VAC   |
| Output Voltage                  | V <sub>OUT</sub> | 30         | V     |
| LED Current                     | I <sub>LED</sub> | 530        | mA    |
| Output Power                    | P <sub>OUT</sub> | 16         | W     |
| Efficiency (full load)          | η                | >82        | %     |
| Power Factor                    | PF               | >0.9       |       |
| THD                             | THD              | <20        | %     |

## FEATURES

- Fast Start up
- Triac Dimmable, with 1% to 100% dimming range and the dimming curve meets standard SSL6
- Analog-Dimmable
- Real current control without secondary-feedback circuit
- Unique architecture for superior line regulation
- High power factor>0.9 over 108Vac to 305Vac
- Boundary conduction mode improves efficiency
- Input UVLO
- Cycle-by-cycle current limit
- Over-voltage protection (OVP)
- Over-current protection (OCP)
- Over-temperature protection (OTP)
- Fit inside PAR38 bulb enclosure

## APPLICATIONS

- Solid State Lighting
- Industrial & Commercial Lighting
- Residential Lighting

All MPS parts are lead-free and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology", are Registered Trademarks of Monolithic Power Systems, Inc.

High Voltage

**Warning:** Although this board is designed to satisfy safety requirements, the engineering prototype has not been agency approved. Therefore, all testing should be performed using an isolation transformer to provide the AC input to the prototype board.

## CIRCUIT DESCRIPTION

The EV4031-S-00A is configured in a single-stage Flyback topology, it uses primary-side-control which can mostly simplify the schematic and get a cost effective BOM. It can also achieve high power factor and accurate LED current.

F1, L1, L2, L3, R1, R14, R13, CX1, DB1, and C1 compose the input stage. F1 fuses the AC input to protect for the component failure or some excessive short events. L1, L2, L3, R1, R14, CX1, R13 and C1 associated with CY1 form the EMI filter which can meet the standard EN55015. The diode rectifier DB1 rectifies the input line voltage. Small bulk CBB capacitor C1 is used as a low impedance path for the primary switching current, to maintain high power factor, the capacitance of C1 should be selected with low value.

RV1, D10, R25, R26, R27, C12 are used for surge test. RV1 can make sure the circuit pass 500V surge test, for higher level test, a RCD snubber composed of D10, R25, R26, R27 and C12 is needed.

R3, R8, R5, R23, C4, C11, D1, D4, Q1, Q3 with R12 compose the damping circuit for reducing the inrush current at the dimmer turning on time. The circuit let the inrush current flow through R12 at first when triac dimmer turns on. Then Q1 turns on and shorts R12, this can save power from R12. Q3 is used to discharge C4 when the triac is off. D4 is used to clamp the gate voltage of Q1 to 15V.

R4, R7, C3 are used as a bleeder circuit which keeping the triac current above the minimum holding current after triac turns on.

R10, R17, C9 provide sine wave reference for the primary peak current to get an active PFC function. R28 and Q4 parallels R29 with R17, when the input voltage is high, which make sure the MULT pin voltage lower than the max voltage rating, and improves the line regulation in wide input voltage range application.

D12, R24, R31 are used to improve the THD performance at high side input, which is useful in wide input voltage range application.

R11, D7, C10, D11 are used to supply power for MP4031. A 47 $\mu$ F bulk capacitor C10 is selected to maintain the supply voltage. At start-up, C10 is first charged up through the external MOSFET Q2 and internal charging circuit, when the VCC voltage reaches 10V, the internal charging circuit stops charging and the control logic works. Then the power supply is taken over by the auxiliary winding through R11, D7.

R6, C7, D6 and D5 are used for the gate drive of the external MOSFET Q2.

R15, R16, C13, D9 are used to detect the auxiliary winding to get the transformer magnetizing current zero crossing signal for realizing the boundary conduction operation, and also monitor the output OVP condition. The OVP voltage is set by the divider ratio of R15, R16. R21 and D8 are used to restrain the oscillation between the leakage inductor and the parasitical capacitor when OVP happens. If the oscillation happens, the external MOSFET will be turned on/off abnormally and the part can't work in auto restart mode.

U2 is an Optocoupler which optically couples the PWM dimming signal from the secondary side to the primary side. R36, R37, R38, and C17 convert the PWM signal into an analog signal, which is divided by R30 and R19, then put into CS pin.

D13, R32, C14, Q5, R33, C15, U3, R34, R35, C16 compose a LDO, which is the power supply for Optocoupler.

R18, R20 are primary sensing resistors for primary side current control. The value of R18, R20 set the output LED current. C2, R2, R22, D3 are used to damp the leakage inductance energy so the drain voltage can be suppressed at a safe level.

Diode D2 rectifies the secondary winding voltage and the capacitor C5, C6 are the output filter. The resistor R9 is placed as pre-load to limit the output voltage rise too high in open load condition.

## TRANSFORMER SPECIFICATION

### Electrical Diagram

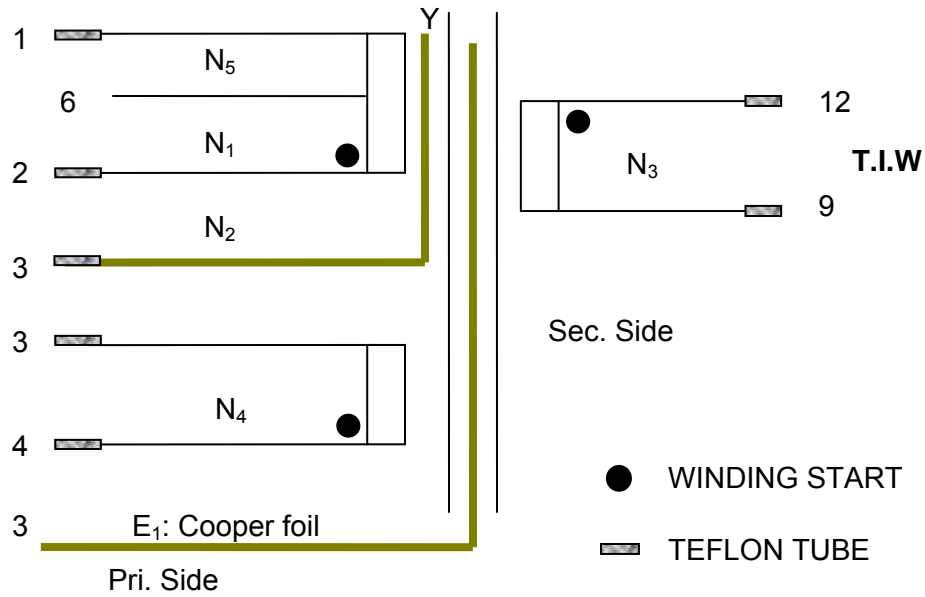

Figure 4—Transformer Electrical Diagram

**Notes:**

1. Don't connect Y to any pin of Bobbin.
2. E<sub>1</sub> is one layer of cooper foil applied to core, and connected to PIN3 by a wire.

### Winding Diagram

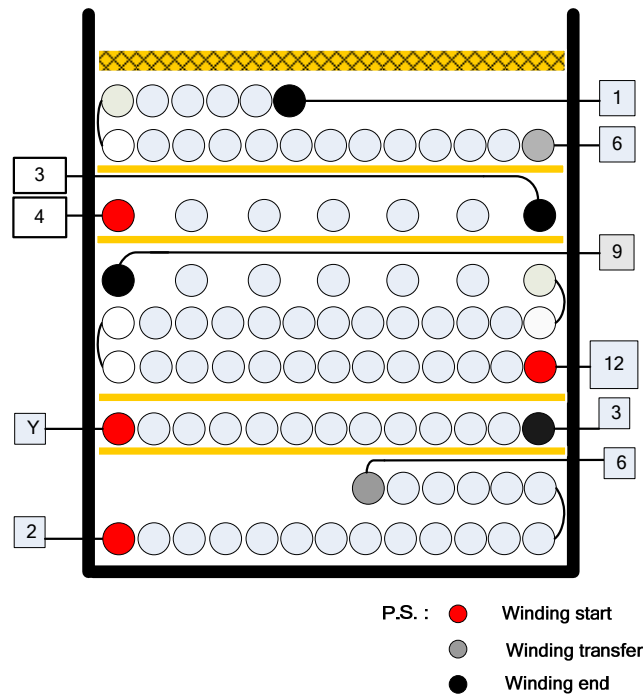

Figure 5—Winding Diagram

**Winding Order**

| Winding No.    | Tape Layer Number | Start & End | Magnet Wire $\Phi$ (mm) | Turns     |
|----------------|-------------------|-------------|-------------------------|-----------|
| N <sub>1</sub> | 2                 | 2→6         | 0.23mm * 1              | 47        |
| N <sub>2</sub> | 2                 | 3→Y         | 0.15mm * 1              | one layer |
| N <sub>3</sub> | 2                 | 12→9        | 0.30mm * 2 (T.I.W)      | 25        |
| N <sub>4</sub> | 2                 | 4→3         | 0.15mm * 1              | 20        |
| N <sub>5</sub> | 3                 | 6→1         | 0.23mm * 1              | 48        |
| E <sub>1</sub> | 3                 |             | One layer Cooper foil   |           |

**Electrical Specifications**

|                                   |  |            |

### Electric Strength Test

Primary circuit to secondary circuit electric strength testing was completed according to IEC61347-1 and IEC61347-2-13.

Input and output was shorted respectively. 3750VAC/50Hz sine wave applied between input and output for 1min, and operation was verified.

### Surge Test

Line to Line 3000V surge testing was completed.

Input voltage was set at 230VAC/50Hz. Output was loaded at full load and operation was verified following each surge event.

| Surge Level (V) | Input Voltage (VAC) | Injection Location | Injection Phase (°) | Test Result (Pass/Fail) |
|-----------------|---------------------|--------------------|---------------------|-------------------------|
| 3000            | 230                 | L to N             | 0                   | Pass                    |
| -3000           | 230                 | L to N             | 0                   | Pass                    |

### Thermal Test

Test without dimmer and with dimmer at 90% dimming on phase.

Without dimmer @110Vac

Without dimmer @110Vac

With dimmer at 90% dimming on phase

OCP

## EVB TEST RESULTS

Performance waveforms are tested on the evaluation board.

$V_{IN}=108-305VAC$ , 9 LEDs in series,  $I_{LED}=530mA$ ,  $V_{OUT}=30V$ ,  $L_P=1.74mH$ ,  $N_P:N_S:N_{AUX}=95:25:20$

### Conducted EMI

$V_{IN}=110Vac/50Hz$ , Full Load  
L Line, RBW=9kHz, MT=20ms

### Conducted EMI

$V_{IN}=110Vac/50Hz$ , Full Load  
N Line, RBW=9kHz, MT=20ms

### Conducted EMI

$V_{IN}=230Vac/50Hz$ , Full Load  
L Line, RBW=9kHz, MT=20ms

### Conducted EMI

$V_{IN}=230Vac/50Hz$ , Full Load  
N Line, RBW=9kHz, MT=20ms

### TRIAC Dimming Curve

$V_{IN}=120Vac/60Hz$ ,  
Full Load with different Dimmers

### Line Regulation

Full Load

### PF vs. VIN

$V_{IN}=(85-135)Vac/60Hz$ , Full Load

### PF vs. VIN

$V_{IN}=(185-265)Vac/50Hz$ , Full Load

### THD vs. VIN

$V_{IN}=(85-135)Vac/60Hz$ , Full Load

## EVB TEST RESULTS *(continued)*

Performance waveforms are tested on the evaluation board.

$V_{IN}=108-305VAC$ , 9 LEDs in series,  $I_{LED}=530mA$ ,  $V_{OUT}=30V$ ,  $L_P=1.74mH$ ,  $N_P:N_S:N_{AUX}=95:25:20$ .

**Input Voltage and Current**

$V_{IN} = 110Vac/60Hz$ , Full Load

**Input Voltage and Current**

$V_{IN} = 220Vac/50Hz$ , Full Load

**Steady State**

$V_{IN} = 110Vac/60Hz$ , Full Load

**Steady State**

$V_{IN} = 220Vac/50Hz$ , Full Load

**VIN Start Up**

$V_{IN} = 110Vac/60Hz$ , Full Load

**VIN Start Up**

$V_{IN} = 220Vac/50Hz$ , Full Load

**OVP**

LED Load open when working and then recovery

$V_{IN} = 110Vac/60Hz$ , Full Load

**OVP**

LED Load open when working and then recovery

$V_{IN} = 220Vac/50Hz$ , Full Load

**OCP**

LED+ Short to LED- when working and then recovery

$V_{IN} = 110Vac/60Hz$ , Full Load

**EVB TEST RESULTS (continued)**

Performance waveforms are tested on the evaluation board.

 $V_{IN}=108-305VAC$ , 9 LEDs in series,  $I_{LED}=530mA$ ,  $V_{OUT}=30V$ ,  $L_P=1.74mH$ ,  $N_P:N_S:N_{AUX}=95:25:20$ .

**OCP**

 LED+ Short to LED- when working and then recovery  
 $V_{IN} = 220Vac/50Hz$ , Full Load

**TRIAC Dimming Performance Max Dimming on Phase**
 $V_{IN} = 110Vac/60Hz$ , Full Load

**TRIAC Dimming Performance Min Dimming on Phase**
 $V_{IN} = 110Vac/10Hz$ , with dimmer

**Analog Dimming Performance**

 Dimming Signal=0V,  
 $V_{IN} = 110Vac/60Hz$ 

**Analog Dimming Performance**

 Dimming Signal=5.1V,  
 $V_{IN} = 110Vac/60Hz$ 

**Analog Dimming Performance**

 Dimming Signal=10V,  
 $V_{IN} = 110Vac/60Hz$ 

## QUICK START GUIDE

1. Preset AC Power Supply to  $108\text{VAC} \leq V_{\text{IN}} \leq 305\text{VAC}$ .
2. Turn Power Supply off.
3. Connect the LED string between “LED+” (anode of LED string) and “LED-” (cathode of LED string).
4. Connect Power Supply terminals to AC  $V_{\text{IN}}$  terminals as shown on the board.
5. Turn AC Power Supply on after making connections.
6. For Triac dimming LED lighting application, especially in deep dimming situation, the LED would shimmer caused by the dimming on duty which is not all the same in every line cycle. What's more, the Grid has noise or inrush which would bring out shimmer even flicker. The suppressor circuit would help to improve this. For detailed information please refer to appendix.

## APPENDIX

### RIPPLE SUPPRESSOR

(Innovative Proprietary)

For Triac dimming LED lighting application, a single stage PFC converter needs large output capacitor to reduce the ripple whose frequency is double of the Grid. And in deep dimming situation, the LED would shimmer caused by the dimming on duty which is not all the same in every line cycle. What's more, the Grid has noise or inrush which would bring out shimmer even flicker. Figure 6 shows a ripple suppressor, which can shrink the LED current ripple obviously.

Figure 6: Ripple Suppressor

#### Principle:

Shown in Figure 6, Resistor R, capacitor C, and MOSFET M compose the ripple suppressor. Through the RC filter, C gets the mean value of the output voltage  $V_{Co}$  to drive the MOSFET M. M works in variable resistance area. C's voltage  $V_C$  is steady makes the LEDs voltage is steady, so the LEDs current will be smooth. MOSFET M holds the ripple voltage  $v_{Co}$  of the output.

Diode D and Zener diode  $D_Z$  are used to restrain the overshoot at start-up. In the start-up process, through D and  $D_Z$ , C is charged up quickly to turn on M, so the LED current can be built quickly. When  $V_C$  rising up to about the steady value, D and  $D_Z$  turn off, and C combines R as the filter to get the mean voltage drop of  $V_{Co}$ .

The most important parameter of MOSFET M is the threshold voltage  $V_{th}$  which decides the power loss of the ripple suppressor. Lower  $V_{th}$  is better if the MOSFET can work in variable resistance area. The BV of the MOSFET can be selected as double as  $V_{Co}$  and the Continues

Drain current level can be selected as decuple as the LEDs' current at least.

About the RC filter, it can be selected by  $\tau_{RC} \geq 50/f_{LineCycle}$ . Diode D can select 1N4148, and the Zener voltage of  $D_Z$  is as small as possible when guarantee  $V_D + V_{DZ} > 0.5 \cdot V_{Co\_PP}$ .

#### Optional Protection Circuit

In large output voltage or large LEDs current application, MOSFET M may be destroyed by over-voltage or over-current when LED+ shorted to LED- at working.

#### Gate-Source (GS) Over-voltage Protection:

Figure 7: Gate-Source OVP Circuit

Figure 7 shows GS over-voltage protection circuit. Zener diode  $D_G$  and resistor  $R_G$  are used to protect MOSFET M from GS over-voltage damaged. When LED+ shorted to LED- at normal operation, the voltage drop on capacitor C is high, and the voltage drop on Gate-Source is the same as capacitor C. The Zener diode  $D_G$  limits the voltage  $V_{GS}$  and  $R_G$  limits the charging current to protect  $D_G$ .  $R_G$  also can limit the current of  $D_Z$  at the moment when LED+ shorted to LED-.  $V_{DG}$  should bigger than  $V_{th}$ .

#### Drain-Source Over-voltage and Over-current Protection

As Figure 8 shows, NPN transistor T, resistor  $R_C$  and  $R_E$  are set up to protect MOSFET M from over-current damaged when output short occurs at normal operation. When LED+ shorted to LED-, the voltage  $v_{DS}$  of MOSFET is equal to the  $v_{Co}$  which has a high surge caused by the parasitic parameter. Zener Diode  $D_{DS}$  protects MOSFET

from over-voltage damaged. Transistor T is used to pull down the  $V_{GS}$  of M. When M turns off, the load is opened, MP4031 detects there is an OVP happened, so the IC functions in quiescent. The pull down point is set by  $R_C$  and  $R_E$ :

$$R_C/R_E \cdot \frac{V_{CO}}{2} = 0.7V.$$

**Figure 8: Drain-Source OVP and OCP Circuit**

**Table 1: MOSFET LIST**

| Manufacture P/N | Manufacture | $V_{DS}/I_D$ | $V_{th}(V_{DS}=V_{GS}@T_J=25^\circ C)$ | Power Stage |
|-----------------|-------------|--------------|--|-------------|
| Si4446DY        | Vishay      | 40V/3A       | 0.6-1.6V@ $I_d=250\mu A$               | <10W        |
| FTD100N10A      | IPS         | 100V/17A     | 1.0-2.0V@ $I_d=250\mu A$               | 5-15W       |
| P6015CDG        | NIKO-SEM    | 150V/20A     | 0.45-1.20V@ $I_d=250\mu A$             | 10-20W      |
