

The Future of Analog IC Technology®

# EV4460DQ-00B

2.5A, 4MHz, 36V

## Step-Down Converter Evaluation Board

### DESCRIPTION

The EV4460DQ-00B is an evaluation board for the MP4460, a high frequency step-down regulator with an integrated power MOSFET.

The wide input range of MP4460 accommodates a variety of step-down applications, including those in an automotive input environment. A 100µA operational quiescent current allows use in battery-powered applications.

The frequency foldback helps prevent inductor current runaway during startup and thermal shutdown provides reliable, fault tolerant operation.

By switching at 4MHz, the MP4460 is able to prevent EMI (Electromagnetic Interference) noise problems, such as those found in AM radio and ADSL applications.

### FEATURES

- 2.5 A Output Current
- Wide 7.5V to 36V Operating Range
- Output at 3.3V
- Up to 95% Efficiency
- Up to 4MHz Programmable Switching Frequency
- Ceramic Capacitor Stable
- Internal Soft-Start

### APPLICATIONS

- High Voltage Power Conversion
- Automotive Systems
- Industrial Power Systems
- Distributed Power Systems
- Battery Powered Systems

"MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

### ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	V <sub>IN</sub>	7.5 – 36	V
Output Voltage	V <sub>OUT</sub>	3.3	V
Output Current	I <sub>OUT</sub>	2.5	A

### EV4460DQ-00B EVALUATION BOARD

(L x W x H) 2.1" x 1.3" x 0.3"  
(5.3cm x 3.3cm x 0.7cm)

Board Number	MPS IC Number
EV4460DQ-00B	MP4460DQ

Efficiency vs. Output Current

## EVALUATION BOARD SCHEMATIC

## QUICK START GUIDE

1. Connect the positive terminal of the load to VOUT pins, and the negative terminal of the load to GND pins.
2. Preset the power supply output to 12V and turn off the power supply.
3. Connect the positive terminal of the power supply output to the VIN pin and the negative terminal of the power supply output to the GND pin.
4. Turn the power supply on. The EV4460 will automatically start up.
5. To use the Enable function, apply a digital input to EN pin. Drive EN higher than 1.5V to turn on the regulator, drive EN less than 1.2V to turn it off.
6. An input under voltage lockout (UVLO) function is implemented by the addition of a resistor divider R1 and R2. The EN threshold is 1.5V (rising edge), so VIN UVLO threshold is  $1.5V \times (1+R2/R1)$ . It's preset to 7.5V on this board.
7. Use R3 to re-program switching frequency if needed,  $f_s(\text{kHz}) = \frac{60000}{R3(\text{k}\Omega)^{0.91}}$ . The switching frequency is preset to 500kHz on this board. Please note that an external bootstrap diode from 5V supply to BST pin is necessary to boost gate drive voltage if switching frequency is above 2MHz because the charge time is reduced at high switching frequency.
8. Use R4, R6 to set output voltage,  $V_{FB}=0.8V$ . For  $R2=40.2\text{k}\Omega$ , R1 can be determined by:  $R1 = 50.25 \times (V_{OUT} (V) - 0.8) (\text{k}\Omega)$ . Please follow the application information on the datasheet to recalculate/or select compensation values, inductor value, and output capacitor value when the  $V_{OUT}$  is changed.
