

DESCRIPTION

The EV8606DL-00A is a fully integrated high frequency synchronous rectified step-down switch mode converter. It offers a very compact solution to achieve 6A continuous output current over a wide input supply range with excellent load and line regulation. The MP8606 operates at high efficiency over a wide output current load range.

Constant-On-Time (COT) control mode provides fast transient response and eases loop stabilization.

Full protection features include OCP, OVP, UVP and thermal shut down.

The EV8606DL-00A requires a minimum number of readily available standard external components and is available in a space saving 3mm x 4mm 20-pin QFN package.

ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage Range	V _{IN}	2.9-6	V
Output Voltage	V _{OUT}	1	V
Load Max	I _{OUT}	6	A

FEATURES

- Wide 2.9V to 6V Operating Input Range
- 6A Output Current
- Low R_{DS(ON)} Internal Power MOSFETs
- Proprietary Switching Loss Reduction Technique
- 1% Reference Voltage
- Soft Shutdown
- Programmable Switching Frequency
- OCP, OVP, UVP Protection and Thermal Shutdown
- HICCUP during OCP/SCP
- Output Adjustable from 0.65V to 5.5V
- Available in 20-pin QFN3x4 Package

APPLICATIONS

- Notebook Systems and I/O Power
- Networking Systems
- Digital Set Top Boxes
- Personal Video Recorders
- Flat Panel Television and Monitors
- Distributed Power Systems

All MPS parts are lead-free and adhere to the RoHS directive. For MPS green status, please visit MPS website under Products, Quality Assurance page.

Figure 4— Inner Layer 2

Figure 5—Bottom Layer

QUICK START GUIDE

The default output voltage of this board is set to 1V.

The board layout accommodates most commonly used inductors and output capacitors.

1. Attach the positive and negative ends of the load to the VOUT and GND pins, respectively.
2. Attach the input voltage ($2.9V \leq V_{IN} \leq 6V$) and input ground to the VIN and GND pins, respectively. Then the board is powered up.
3. The EV8606DL-00A is enabled ON in default. It's turned on once the input voltage is applied. To enable the board externally, apply a voltage, $V_{EN} \geq 2V$, to the EN pin. To disable the board, apply a voltage, $V_{EN} \leq 0.4V$, to the EN pin.

Setting the Output Voltage

Case 1: POSCAP, OSCON or Aluminum capacitors used in the output

1. Choose a value for R2. A value within $5k\Omega$ - $40k\Omega$ is recommended to ensure stable operation.
2. R1 is determined as follows:

$$R_1 = \frac{V_{OUT} - V_{REF}}{V_{REF}} \times R_2$$

Where V_{REF} is 0.6V

Case 2: Ceramic capacitors used in the output

An external voltage ramp should be added to FB through resistor R4 and capacitor C4.

1. Choose a value for C4 within 100-680pF.
2. Determine R4 as follows:

$$V_{RAMP} = \frac{(V_{IN} - V_{OUT}) \times T_{ON}}{R4 \times C4}$$

Where V_{ramp} is the external ramp voltage generated to FB. 30mV should be enough for most of the applications.

3. Choose a value within $5k\Omega$ - $40k\Omega$ for R2.
4. The value of R1 then is determined as follows:

$$R1 = \frac{1}{\frac{V_{REF} + \frac{1}{2} V_{RAMP}}{R2(V_{OUT} - V_{REF} - \frac{1}{2} V_{RAMP})} - \frac{1}{R4}}$$

5. Make sure the ramp circuit impedance is much smaller than the FB circuit impedance as follows:

$$\frac{1}{2\pi \times F_s \times C4} < \frac{1}{5} \left(\frac{R1 \times R2}{R1 + R2} \right)$$

If not, restart from step 1 until it fulfills the above condition.

Layout Recommendation

1. Put the input capacitors (C1A) as close as to the VIN pin.
2. Put the decoupling capacitor (C5) as close as to the VCC pin.
3. Put the inductor as close as to SW pin. Make the SW pad as small as possible to minimize the switching noise interference.
4. Place feedback resistor divider close to the FB pin. The FB pin is directly connected to the PWM comparator. It should be routed away from the noisy SW node.
