EVX2001-Y-00C

90VAC~265VAC/50Hz/60Hz, 12V/5A
Evaluation Board

DESCRIPTION

The EVX2001-Y-00C Evaluation Board is mainly designed to demonstrate the capabilities of MPS highly integrated controller MPX2001. The MPX2001 is an all-in-one flyback controller aims at high-performance and high-integration solution. It combines the primary side driver, secondary side controller and synchronous rectifier (SR) driver in one chip. So the opto-coupler and TL431 can be removed from the secondary side and SR can be turned off on time without any shoot through risk.

The EVX2001-Y-00C is typically designed for a general adapter. Its specification is listed in the below table.

ELECTRICAL SPECIFICATION

Parameter	Symbol	Value	Units
Input Voltage	V_{IN}	90 to 265	VAC
Output Voltage	V_{OUT}	12	V
Output Current	I_{OUT}	5	A
Output Power	P_{OUT}	60	W
Efficiency (4 Point Average)	η	≥ 91	%

The EVX2001-Y-00C has excellent efficiency, which can meet CoC V5 and DoE Level VI requirement easily. It meets IEC61000-4-5 surge immunity and EN55022 conducted EMI requirements. It has multi-protection function, e.g., Brown In/Out, over load protection, over voltage protection, short-circuit protection, cycle by cycle current limit and over-temperature protection, etc.

FEATURES

- 3.5kVrms primary side to secondary side isolation (4.5kVrms isolation voltage for the bare IC)
- 650V integrated HV current source
- 200V integrated SR controller, supporting both DCM and CCM operation
- Precise constant voltage (CV), $\pm 5\%$ CV including transient response
- Extremely low operating current in standby mode
- Frequency modulation and peak current mode control, with slope compensation, line compensation and leading edge blanking
- Adjustable cable drop compensation
- Advanced protections, including primary sensed output Over Voltage Protection (OVP) and Primary Over Current Protection (POCP), real secondary sensed output Over Load Protection (OLP), Brown-in/Brown-out (B/O, B/I), Short Circuit Protection (SCP), Current-Sensing Short Protection (SSP), internal Thermal Shut Down (TSD), Under Voltage Locked-Out (UVLO), and External triggered Protection (Ext.P)

CIRCUIT DESCRIPTION

The EVX2001-Y-00C is a single-stage flyback converter with All-in-One controller. The input is universal and output is 12V/5A. The All-in-One controller integrates primary side and secondary side in one chip so the opto-coupler and TL431 can be saved.

F1, LX1, LX2, CX1, BD1, RX1 and RX2 compose the input stage. F1 is the fuse and is used to protect the component failure or some excessive short events. LX1, LX2 and CX1 are configured the EMI filter to suppress conducted EMI. BD1 is the rectifier bridge to convert AC voltage to DC voltage. RX1 and RX2 are the discharging resistors to make CX1 discharging time compliant with safety regulation.

C1 is the filter capacitor. D1, R5, R6, R24 and C2 are configured RCD snubber to suppress voltage spike of Mosfet.

R12, C3, C5 and D3 are used as Vcc power supply. C18 and R25 are configured as the RC snubber for D3.

D5, R23 and Q3 are optional OVP circuit. The OVP threshold can be set by this external circuit.

MPX2001 and its peripheral components are configured flyback controller circuit. MPX2001 integrates the primary side and secondary side controller in one chip so the opto-coupler and TL431 can be saved.

Q1 is the main switch and R4, R7 and R9 are the current sensing resistors.

T1 is the transformer to transfer the power from primary side to secondary side. It is key component for the whole circuit normal working with good performance. So it should be designed carefully.

CY1 is Y capacitor lowering common mode noise to make sure there is enough EMI margin. 100pF capacitance is large enough, which won't introduce much common mode noise between primary side and secondary side.

Q2 is secondary synchronous rectifier (SR) and R15A, R15B and C8 are their snubber to suppress SR high voltage spike.

C10, C12 and C14 are output capacitors. LX3 is the optional common mode inductor for better EMI performance.

R18, C9 and C17 are configured as the compensation network. R20 and R21 are feedback resistors. R22 is the output current sensing resistor for the over current protection.

230Vac, 50Hz, Maximum Load, N Line, Output GND floats, EN55022 Limits

Thermal Test

Test with 90Vac/265Vac input and full load condition. PCB layout with 1Oz copper. TA=28°C.

Vin=90Vac

Vin=265Vac

Quick Start Guide

1. Preset Power Supply to $90\text{VAC} \leq V_{\text{IN}} \leq 265\text{VAC}$.
2. Turn Power Supply off.
3. Connect the Line and Neutral terminals of the power supply output to L and N port. For three-wire input application, make OUTPUT GND connected to Earth.
4. Connect Load to:
 - a. Positive (+): VOUT
 - b. Negative (-): GND
5. Turn Power Supply on after making connections.
