

MP3336A

Dual-Channel, Flash LED Driver with 2A/Ch and I²C Interface

DESCRIPTION

The MP3336A is a compact, dual-channel, high-power, flash LED driver that can drive up to 2A in flash mode for each LED. The MP3336A improves image and video quality in low light environments for camera phones. The MP3336A operates with a selectable 1/2/3/4MHz switching frequency and uses a synchronous, current-mode PWM boost converter to regulate the LED current with two high current sources. The MP3336A provides a highly efficient, optimized solution for smaller PCB spaces.

The MP3336A features a standard I²C interface, dual LED channels, rich protection modes, and high power density and performance. The MP3336A can also support flash, assist, indicator, and 5V DC modes.

The cathodes of the dual-flash LED are referenced to GND, which improves thermal performance in layout. The MP3336A is available in a WLCSP-20 (1.6mmx2.0mm) package.

FEATURES

- 2.7V~5.5V Input Voltage
- 1/2/3/4MHz Selectable Max F_{sw}
- F_{sw} Fold-Back Function
- 400kHz I²C Compatible Interface
- Standby/Flash/Assist/Indicator/5V DC Modes

Flash Mode

- Up to 2A/Ch Programmable Current with ±7% Accuracy for Each LED, 7.84mA/Step

Assist Mode

- Up to 319mA/Ch Programmable Current with ±7% Accuracy for Each LED, 1.25mA/Step

Indicator Mode

- Works in 31.5kHz PWM Dimming Mode with 2/16, 3/16, 4/16, 5/16 Duty Cycles
- Used for Blinking and 128/256/512ms Selectable Blinking Time

5V DC Mode

- Output Constant 5V DC Voltage
- Separated EN1 Pin for NFC Application
- 1A to 5.5A Programmable Input DC Current Limit Protection
- External Strobe/TX Pin
- VIN to VOUT Disconnection Function
- Low-Battery Voltage Protection
- LED Short/Open Protection
- VOUT-GND Short Protection
- Over-Voltage Protection (OVP)
- Over-Temperature Protection (OTP)
- Input Under-Voltage Lockout (UVLO) Protection
- WLCSP-20 (1.6mmx2.0mm) Package

APPLICATIONS

- Smartphone Flash LED Application
- Cameras for Tablets
- Digital Still Camera

All MPS parts are lead-free, halogen-free, and adhere to the RoHS directive. For MPS green status, please visit the MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are registered trademarks of Monolithic Power Systems, Inc.

PACKAGE REFERENCE

PIN FUNCTIONS

| Pin # | Name | Description |
|-----------|------|---|
| A4, B4 | LED1 | Current source for LED1. Connect the anode of the LED to LED1. |
| C4, D4 | LED2 | Current source for LED2. Connect the anode of the LED to LED2. |
| E4 | TX | Synchronization input signal for RF transmission signal. TX is pulled low internally if left floating. |
| A3, B3,C3 | VOUT | Boost converter output. |
| D3 | EN | IC enable pin. |
| E3 | STR | Strobe signal input. STR synchronizes the flash pulse to the image capture. STR is pulled low internally if left floating. |
| A2, B2 | SW | Boost converter switching node. |
| C2 | EN1 | Enable 5V mode pin. This pin enables the IC to enter 5V mode even if the EN pin is low. |
| D2 | SCL | I²C interface clock signal. |
| E2 | SDA | I²C interface data. |
| A1, B1 | PGND | Power GND. |
| C1 | AGND | Analog GND. |
| D1 | VIN | Input supply. VIN provides power for the internal power and logic circuits. VIN must be bypassed locally. |
| E1 | NTC | LED temperature detection. Connect NTC to a negative thermal coefficient resistor when in use. Float NTC when not in use. |

ABSOLUTE MAXIMUM RATINGS ⁽¹⁾

| | |
|---|---------------------------------|
| V _{IN} , V _{SW} , V _{OUT} | -0.3V to +6V |
| NTC | -0.3V to V _{IN} + 0.3V |
| All other pins | -0.3V to +6V |
| Junction temperature | 150°C |
| Lead temperature..... | 260°C |
| Continuous power dissipation (T _A = 25°C) ⁽²⁾ | |
| WLCSP-20 (1.6mmx2.0mm) | 2.3W |

Recommended Operating Conditions ⁽³⁾

| | |
|--|-----------------|
| Supply Voltage (V _{IN})..... | 2.7V to 5.5V |
| Operating junction temp. (T _J).... | -40°C to +125°C |

| | | |
|--|-----------------------|-----------------------|
| Thermal Resistance ⁽⁴⁾ | θ_{JA} | θ_{JC} |
| WLCSP-20 (1.6mmx2.0mm) ... | 55 | 0.5 .. °C/W |

NOTES:

- 1) Exceeding these ratings may damage the device.
- 2) The maximum allowable power dissipation is a function of the maximum junction temperature T_J (MAX), the junction-to-ambient thermal resistance θ_{JA}, and the ambient temperature T_A. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P_D (MAX) = (T_J (MAX)-T_A)/θ_{JA}. Exceeding the maximum allowable power dissipation produces an excessive die temperature, causing the regulator to go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- 3) The device is not guaranteed to function outside of its operating conditions.
- 4) Measured on JESD51-7, 4-layer PCB.

ELECTRICAL CHARACTERISTICS
V_{IN} = 3.6V, T_A = 25°C, unless otherwise noted.

BLOCK DIAGRAM

Figure 1: Functional Block Diagram

OPERATION

The MP3336A is a dual-channel, LED driver with an I²C interface that supports image capture for camera flash. The MP3336A works in flash mode, assist mode, indicator mode, and fixed 5V DC output mode. Table 1 shows how to set these operation modes.

LED Driver Operation

The MP3336A is a synchronous, current-mode, PWM, boost converter that works with 1/2/3/4MHz. The MP3336A regulates the boost loop by detecting and controlling the headroom voltage across the current source ($V_{OUT} - V_{LED1/2}$).

When the device is enabled by LED_EN, the synchronous PMOS works as a 400mA current source first to charge the output capacitor until V_{OUT} rises above 2.3V. The device changes to boost switching mode if the voltage across the current source is less than the target headroom reference. If V_{IN} is very close to V_{OUT} , the IC switches to boost switching mode and pass mode automatically to minimize power loss. In pass mode, the synchronous PMOS is fully turned on. During the current start-up, the current ramps up step-by-step smoothly until the target setting current is reached.

Table 1: Operation Mode Setting

| Configuration | | | | | | | | Mode |
|---------------|------|---------|-------|-----------|---------|--------|---------|-----------|
| TX | EN1 | EN1_OFF | STR | LED1/2_EN | STR_MOD | 5V_MOD | LED_MOD | |
| X | High | 0 | Float | X | X | X | XX | 5V |
| X | X | 1 | Float | 1 | X | X | 10 | Assist |
| X | X | 1 | X | 1 | X | X | 01 | Indicator |
| 0 | X | 1 | High | 1 | 1 | X | 11 | Flash |
| High | X | 1 | High | 1 | 1 | X | 11 | Flash |
| X | X | 1 | X | 1 | 0 | X | 11 | Flash |
| X | X | 1 | X | X | X | 1 | X | 5V |

Standby Mode

By default, if V_{IN} is higher than UVLO and EN is pulled high, the device enters standby mode. In this mode, only the I²C is active and ready to communicate with the host.

Assist Mode

To enter assist mode, set the LED_MOD register to 10 and LED1/2_EN to 1. The current ramps up to the target value, which is set by I1_TOR and I2_TOR. The ramp-up slew rate can be set by register TUP_I. The current can be disabled by switching to standby mode or by setting the LED1/2_EN bits to 0. These two bits control the two LED current sources respectively (see Figure 2).

Figure 2: Assist Mode

Indicator Mode

When LED_MOD is set to 01 and LED_EN1/2 is set to 1, the MP3336A enters indicator mode, which provides a low-current output (see Figure 3). In this mode, the driver current sources work in a 31.5kHz PWM dimming mode. The current amplitude can be set by I1_TOR and I2_TOR, while the indicator current step ramps up more quickly at a rate of 7.84mA/step, compared to assist mode's ramp-up rate of 1.25mA/step. The final amplitude in this mode can be calculated with Equation (1):

$$7.84\text{mA} \times I1/2_TOR \quad (1)$$

The duty cycle is set by the INDI_PWM register. When disabled, switch to standby mode or set the LED1_EN and LED2_EN bits to 0.

Figure 3: Indicator Mode

In indicator mode, the MP3336A can also work in blinking mode. If blinking is enabled, the IC works in indicator mode during the blinking time, and the LED current source is disabled during the blinking time (see Figure 4). The blinking time is set by the TBK0-1 bits in register 0FH.

Figure 4: Blinking Time

Flash Mode

The device works in flash mode in three ways: hardware and level trigger mode, hardware and edge trigger mode, and software and edge trigger mode.

1. Hardware and Level Trigger Mode

In this mode, STR_MOD = 1, STR_LV = 1, LED1/2_EN = 1, LED_MOD = 11. The flash current begins to ramp up after STR goes high. The current is set by I1_FL and I2_FL, and the ramp-up time is set by TUP_I. The flash current ends when STR is pulled low or when the flash timer ends. After the flash, LED_MOD is reset to standby mode, and LED1/2_EN is set to 0 if LED_SD = 0. If LED_SD = 1, LED_MOD and LED1/2_EN are not reset. The LED1 and LED2 current sources are controlled by the LED1_EN and LED2_EN bits respectively. If the STR is pulled low before the flash timer ends, the flash current shuts down at the STR falling edge (see Figure 5). Conversely, if the flash timer set by FL_TIM ends before STR goes low, the flash current terminates immediately. The time-out indicator bit FT_TO is set to 1 and not cleared

until it is read back or the input power resets (see Figure 6).

Figure 5: Hardware and Level Trigger Flash Mode without Time-Out

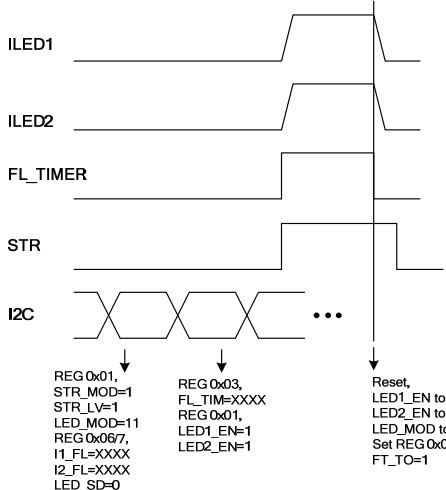

Figure 6: Hardware and Level Trigger Flash Mode with Time-Out

2. Hardware and Edge Trigger Mode

In this mode, STR_MOD = 1, STR_LV = 0, LED1/2_EN = 1, and LED_MOD = 11. The flash current begins to ramp up after STR goes high. The current is set by I1_FL and I2_FL, and the ramp-up time is set by TUP_I. The flash current ends when the flash timer set by FL_TIM ends. After the flash, the LED_MOD is reset to standby mode, and LED1/2_EN is set to 0 if LED_SD = 0. If LED_SD = 1, the mode and LED_MOD and LED1/2_EN are not reset. The LED1 and LED2 current sources are controlled by the LED1_EN and LED2_EN bits respectively (see Figure 7).

Figure 7: Hardware and Edge Trigger Flash Mode

3. Software and Edge Trigger Mode

In this mode, without STR, STR_MOD = 0, LED1/2_EN = 1, and LED_MOD = 11. The flash current begins to ramp up after STR goes high. The current is set by I1_FL and I2_FL, and the ramp-up time is set by TUP_I. The flash current ends when the flash timer set by FL_TIM ends. After the flash, the LED_MOD is reset to standby mode if LED1/2_EN is set to 0 with LED_SD = 0. If LED_SD = 1, the mode and LED_MOD and LED1/2_EN are not reset. The LED1 and LED2 current sources are controlled by the LED1_EN and LED2_EN bits respectively (see Figure 8).

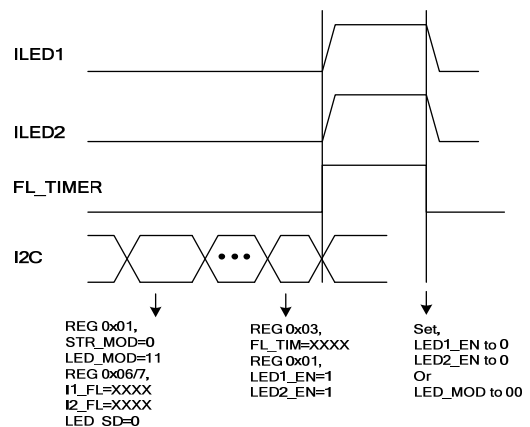

Figure 8: Software and Edge Trigger Flash Mode Assist Mode to Flash Mode

During assist light mode, the device can switch to flash mode from assist mode directly when

STR goes from low to high if STR_MOD = 1. After the flash, the part functions the same way as in flash mode (see Figure 9).

Figure 9: Assist Mode to Flash Mode

5V DC Output Mode

The MP3336A can enter 5V mode whether EN is high or low.

1. EN is low

When EN is low, the IC enters 5V mode by pulling EN1 high. It is especially designed for NFC application.

2. EN is high

a) Through I²C

The IC enters 5V mode by setting 5V_MOD to 1.

b) Through EN1

If EN1_OFF is 0, then the IC can work in 5V mode by pulling EN1 high.

When the MP3336A works in 5V mode, the control loop is taken over by the voltage loop (see Figure 10). The LED current sources can still output a current if the mode conditions are met (described above). Care must be taken to ensure that the thermal condition is normal, since 5V directly powers the LED. It is recommended to set LED1/2_EN to 0 during 5V mode.

The V_{OUT} is programmed by the VOUT bit (5V/5.2V).

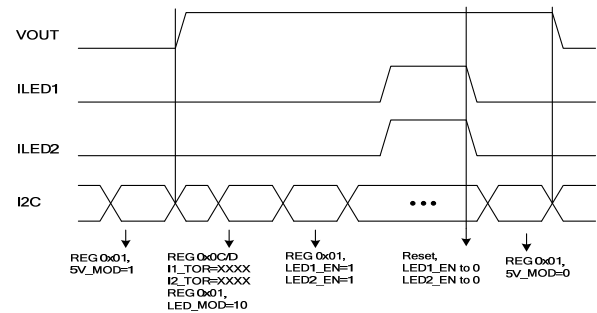

Figure 10: 5V DC Mode through I²C

Maximum Switching Frequency Setting

The maximum switching frequency can be selected by the SW_FS bits when working in boost mode. 1/2/3/4MHz can be selected to optimize efficiency.

Switching Frequency Fold-Back

The MP3336A will work in the max switching frequency set to 2/3/4MHz in switching mode if the voltage of the current source is larger than the value set by the register bits VTH_PAS, otherwise the IC switches to 1MHz to improve efficiency and EMI. If the voltage across the current source is still larger than the value set by the register bits VTH_PAS, the IC can stretch the frequency down with FS_SD = 0. If the LED load becomes lighter and the input voltage increases further, the IC switches to pass mode. With FS_SD = 1, the IC switches directly to pass mode from 1MHz.

If EN1 enables 5V mode, the IC works in pulse skipping mode when there is no load. The IC adds a 300~400μA load to control VOUT well.

LED Output Current Reduction

When the MP3336A works in flash mode, output current reduction may occur in the following conditions:

1. TX is High

During flash mode, if TX goes from low to high, the flash current drops to the current set by I_TX in under 5μs, and the IC sets the FT_TX bit to 1. If TX goes low, the current ramps up to the flash current again (see Figure 11).

Figure 11: Flash Mode with TX Pulse

2. Input DC Current Limit is Triggered

If the input DC current limit set by IL_DC register is not sufficient, a current reduction may occur. The actual current in the IFL_ACT register can be read back during flash.

3. Low Battery Voltage Threshold Is Triggered

During flash pulse, if the battery voltage drops below the threshold set by VBL_RUN, the current reduces step-by-step until the battery voltage rises up to the set low battery voltage threshold. Both the actual current in the IFL_ACT register and the minimum current caused by the current reduction in IFL_MIN can be read back after flash.

Input DC Current Limit Protection

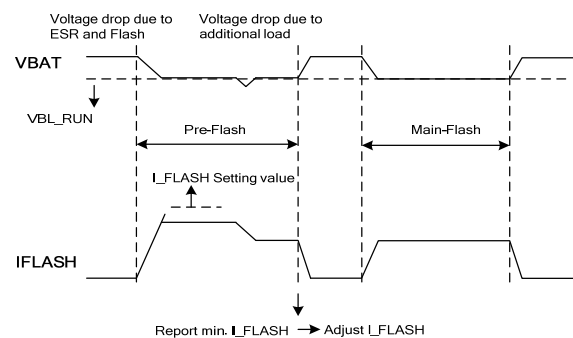

The MP3336A uses the input DC current limit protection to avoid drawing too much current from the battery. This current limit can be programmed by the IL_DC register from 1.66A to 5.5A with 330mA/step when IL_DC < 4.3A and 400mA/step when IL_DC > 4.3A. If the input current hits the input current limit threshold, the LED output current stops increasing and holds until the input current drops below the current limit threshold. The fault bit FT_IDC is set to 1 if the input current limit is triggered. The fault bit remains until it is read back or the input power is reset. The input current limit protection is useful in boost mode because it senses the current of the low-side MOSFET.

Low Battery Voltage Protection

The device provides low battery voltage protection in flash mode in the following ways:

1. Before the flash, if VBL_SD = 1, and the input voltage is lower than the threshold set by VBL_RUN, the device remains disabled and sets the fault bit FT_VBATL to 1. If VBL_SD = 0, the device ramps to the current set by I_TX and sets the fault bit FT_VBATL to 1. The fault bit is cleared after it is read back or when the input power resets.
2. During flash start-up, if the input voltage is lower than the threshold set by VBL_RUN, the current stops ramping. The fault bit FT_VBATL is set. During flash pulse, if the input voltage is lower than the threshold set by VBL_RUN, the current ramps down step-by-step. The fault bit is set until it is read back or when the input power resets.

After the flash, the minimum current caused by the current reduction can be read back through the IFL_MIN register. The IFL_MIN value holds until the next flash occurs or until the power resets. The actual current can be read back through IFL_ACT during flash. This function is useful for determining how much flash current can be drawn from the battery (see Figure 12).

Figure 12: Pre-Flash under Low Battery

NTC Detection

If the register NTC_WD is set to enable NTC detection, the NTC sources a constant 35μA current. If the voltage across the NTC resistor drops below the threshold set by NTC_WD, the internal fault bit FT_LEDHOT is set to 1 and the modes are reset to standby mode if LEDT_SD = 1. If LEDT_SD = 0, the mode setting is not

reset after the fault bit is set. The fault bit remains until it is read back or the power resets. It is recommended to float NTC if this function is not being used.

Figure 13: NTC Detection

VO_{UT}-GND Short Protection

If $V_{OUT} < 1V$, the device stops switching and disconnects the synchronous PMOS to prevent a large current from being drawn from the battery. Set the FT_VOSC bit to 1 and reset the mode setting. The fault bit remains until it is read back or the power resets.

LED1/2-GND Short Protection

If $LED1 < 1V$ and $I_{LED1} > 5mA$, or $LED2 < 1V$ and $I_{LED2} > 5mA$, the IC marks off the current source and sets the fault bit FT_LEDSC but continues switching. If both current sources are marked off, the device stops switching and the mode setting is reset. The fault bit FT_LEDSC is 1 until it is read back or the power resets. If LED_EN1 is set to 0, the feedback of current source 1 is not involved in the loop control, and fault detections on this channel are disabled.

LED1/2 Open Protection

If $V_{OUT} - V_{LED1/2} < 110mV$ and $V_{OUT} > 5.5V$, the IC marks off the fault current source and sets the fault bit FT_OVP but continues switching. If both current sources are marked off, the device stops switching and the mode setting is reset. The fault bit FT_OVP is 1 until it is read back or the power resets. If LED_EN1 is set to 0, the feedback of current source 1 is not involved in loop control, and fault detection on this channel is disabled.

Output Over-Voltage Protection (OVP)

If $V_{OUT} > 5.5V$, the device stops switching and resumes normal operation once V_{OUT} drops below 5.2V. The fault bit FT_OVP is 1 until it is read back or the power resets.

Junction Over-Temperature Protection

If LED_OTAD = 1, the flash current drops to the current set by I_TX when $T_J > 130^{\circ}C$. The fault bit FT_OTP is set to 1. If $T_J > 150^{\circ}C$, the device stops switching and resets LED_MOD and LED_EN1/2. The fault bit FT_OTP must be cleared to 0 by a read-back or a power reset.

Time-Out Protection

If the device works in one of the flash modes—hardware and level trigger mode—time-out protection may be triggered. When the STR input pulse is longer than the flash timer set by FL_TIM, the device is disabled once the timer ends. The device stops switching and resets the mode setting; the fault bit is 1 until it is read back or the power is reset before restarting.

Under-Voltage Lockout (UVLO) Protection

If VIN drops below the UVLO threshold, the device stops and all of the registers are reset to default.

I²C Interface Register Description

I²C Chip Address

After the start condition, the I²C compatible master sends a seven-bit address followed by an eighth read (Read: 1) or write (Write: 0) bit. The following bit indicates the register address to or from which the data is written or read. The I²C address of the MP3336A is 0x27.

Table 3: Mode Setting Register

| Addr: 0x01 | | | | |
|------------|----------|--------|---------|---|
| Bit | Bit Name | Access | Default | Description |
| 7 | STR_LV | RW | 1 | Flash mode trigger mode with strobe pin signal. 0 = edge sensitive 1 = level sensitive |
| 6 | STR_MOD | RW | 1 | Strobe pin enable bit. 0 = software enable 1 = hardware enable |
| 5 | VOUT | RW | 0 | DC Mode V _{OUT} set bit 0 = 5.2V 1 = 5V |
| 4 | LED1_EN | RW | 0 | LED1 current source enable bit. 0 = LED current sink disable 1 = enable |
| 3 | LED2_EN | RW | 0 | LED2 current source enable bit. 0 = LED current sink disable 1 = enable |
| 2:1 | LED_MOD | RW | 00 | Device mode setting bits. 00 = standby 01 = indicator mode 10 = assist mode 11 = flash mode |
| 0 | 5V_MOD | RW | 0 | 5V DC output enable bit. 0 = disable 1 = enable |

Table 4: NTC Detection and Current Limit Setting Register

| Addr: 0x02 | | | | |
|------------|----------|--------|---------|---|
| Bit | Bit Name | Access | Default | Description |
| 7:5 | NTC_WD | RW | 000 | NTC pin detection window. 000 = off 001 = 0.6V 010 = 0.67V 111 = 1.02V |
| 4:3 | IL_PEAK | RW | 01 | Inductor current limit setting bits. 00 = 2.4A 01 = 3.0A 10 = 4.2A 11 = 5.4A |
| 2 | FS_SD | RW | 0 | Disable switching frequency stretching down from 1MHz if VIN is close to VOUT. 0 = enable F _s stretching down function 1 = disable F _s stretching down function |
| 1 | EN1_OFF | RW | 0 | External EN1 pin enable/disable bit. 0: EN1 pin enable 1: EN1 pin disable |
| 0 | NA | RW | NA | Reserved. |

Table 5: Flash Timer Setting Register

| Addr: 0x03 | | | | |
|------------|----------|--------|---------|---|
| Bit | Bit Name | Access | Default | Description |
| 7:4 | FL_TIM | RW | 0001 | Flash timer setting bits. 100ms to 1600ms, 100ms/step. 0000 = 100ms 0001 = 200ms 1111 = 1600ms |
| 3 | LED_SD | RW | 0 | LED_MOD and LED1/2_EN resetting control bit. 0 = reset LED_MOD and LED1/2_EN to default value after flash 1 = no reset |
| 2 | LEDT_SD | RW | 0 | LED_MOD and LED1/2_EN resetting control bit when NTC fault occurs. 0 = no reset and device continues 1 = reset and device stops |
| 1:0 | SW_FS | RW | 00 | Max Switching frequency setting bits. 00 = 4MHz 01 = 3MHz 10 = 2MHz 11 = 1MHz |

Table 6: Low Battery Voltage Setting Register

| Addr: 0x04 | | | | |
|------------|----------|--------|---------|---|
| Bit | Bit Name | Access | Default | Description |
| 7:5 | VBL_RUN | RW | 111 | Low battery voltage setting bits. If VIN drops below this voltage during start-up, the current ramping stops. If, during flash current pulse, the current decreases until VIN is higher than its threshold, it works only in flash mode. 0.1V per step. 000 = 3V 001 = 3.1V 110 = 3.6V 111 = disabled |
| 4 | VBL_SD | RW | 1 | 1 = device disabled when VIN is less than the threshold set by VBL_RUN before flash 0 = enable and current ramps up to current set by I_TX |
| 3:0 | IL_DC | RW | 0100 | Input DC current limit setting bits. 1A to 5.5A. 1.66A to 3.97A: 330mA/step 0000 = 1.66A 0100 = 2.98A 1000 = 4.30A >4.3A: 400mA/step 1001 = 4.7A 1010 = 5.1A 1011 = 5.5A 1100: disable IL_DC function. |

Table 7: Indicator Register

| Addr: 0x05 | | | | |
|------------|----------|--------|---------|--|
| Bit | Bit Name | Access | Default | Description |
| 7 | LED_OTAD | RW | 0 | Adaptive thermal flash current control bit. 1 = current reduces to the current set by I_TX when T _J > 130°C 0 = disable when T _J > 150°C |
| 6:4 | TUP_I | RW | 001 | Current ramp-up time per step. 000 = 8μs 001 = 7μs 111 = 1μs |
| 3:2 | VTH_PAS | RW | 01 | Defines the threshold when F _S drops down to 1MHz or switches to pass mode from boost mode. 00 = 300mV 01 = 450mV 10 = 600mV 11 = 750mV |
| 1:0 | INDI_PWM | RW | 00 | PWM duty cycle of 31.5kHz in indicator mode. 00 = 2/16 01 = 3/16 10 = 4/16 11 = 5/16 |

Table 8: LED1 Flash Current Setting Register

| Addr: 0x06 | | | | |
|------------|----------|--------|----------|---|
| Bit | Bit Name | Access | Default | Description |
| 7:0 | I1_FL | RW | 00110011 | LED1 flash current setting bits. 0 to 2000mA, 7.84mA/step (default 00110011 = 400mA). 00000000 = 0mA 11111111 = 2000mA |

Table 9: LED2 Flash Current Setting Register

| Addr: 0x07 | | | | |
|------------|----------|--------|----------|---|
| Bit | Bit Name | Access | Default | Description |
| 7:0 | I2_FL | RW | 00110011 | LED2 flash current setting bits. 0 to 2000mA, 7.84mA/step (default 00110011 = 400mA). 00000000 = 0mA 11111111 = 2000mA |

Table 10: TX Current Setting Register for LED1

| Addr: 0x08 | | | | |
|------------|----------|--------|----------|---|
| Bit | Bit Name | Access | Default | Description |
| 7:0 | I1_TX | RW | 00110011 | Define the LED1 flash current in flash mode if TX is high. 0 to 2000mA, 7.84mA/step (default 00110011 = 400mA). 00000000 = 0mA 11111111 = 2000mA |

Table 11: TX Current Setting Register for LED2

| Addr: 0x09 | | | | |
|------------|----------|--------|----------|---|
| Bit | Bit Name | Access | Default | Description |
| 7:0 | I2_TX | RW | 00110011 | Define the LED2 flash current in flash mode if TX is high. 0 to 2000mA, 7.84mA/step (default 00110011 = 400mA). 00000000 = 0mA 11111111 = 2000mA |

Table 12: Actual Flash LED Current Register

| Addr: 0x0A | | | | |
|------------|----------|--------|----------|---|
| Bit | Bit Name | Access | Default | Description |
| 7:0 | IFL_ACT | R | 00000000 | The actual flash current in flash mode. 0 to 2000mA, 7.84mA/step. 00000000 = 0mA 11111111 = 2000mA |

Table 13: Minimum Flash LED Current Register

| Addr: 0x0B | | | | |
|------------|----------|--------|----------|--|
| Bit | Bit Name | Access | Default | Description |
| 7:0 | IFL_MIN | R | 00000000 | The minimum flash current caused by low battery voltage current reduction in flash mode. 0 to 2000mA, 7.84mA/step. 00000000 = 0mA 11111111 = 2000mA |

Table 14: LED1 Torch Current/Indicator Amplitude Setting Register

| Addr: 0x0C | | | | |
|------------|----------|--------|----------|--|
| Bit | Bit Name | Access | Default | Description |
| 7:0 | I1_TOR | RW | 00010101 | In assist mode: LED1 current setting bits. 0 to 319mA, 1.25mA/step (default 00010101 = 26mA). 00000000 = 0mA 11111111 = 319mA |
| | | | | In indicator mode: LED1 current amplitude. 7.84mA/step (default 00010101 = 165mA). 00000000 = 0mA 00000001 = 7.84mA..... |

Table 15: LED2 Torch Current/Indicator Amplitude Setting Register

| Addr: 0x0D | | | | |
|------------|----------|--------|----------|--|
| Bit | Bit Name | Access | Default | Description |
| 7:0 | I2_TOR | RW | 00010101 | In assist mode: LED2 current setting bits. 0 to 319mA, 1.25mA/step (default 00010101 = 26mA). 00000000 = 0mA 11111111 = 319mA |
| | | | | In indicator mode: LED2 current amplitude. 7.84mA/step (default 00010101 = 165mA). 00000000 = 0mA 00000001 = 7.84mA..... |

Table 16: Fault and Flag Indication Register

| Addr: 0x0E | | | | |
|------------|----------|--------|---------|---|
| Bit | Bit Name | Access | Default | Description |
| 7 | FT_VBATL | R | 0 | Low battery voltage fault bit. 0 = no fault 1 = fault |
| 6 | FT_OVP | R | 0 | Output over-voltage fault bit. 0 = no fault 1 = fault |
| 5 | FT_VOOSC | R | 0 | VOOUT-GND short fault bit. 0 = no fault 1 = fault |
| 4 | FT_LEDSC | R | 0 | LED short fault bit. 0 = no fault 1 = fault |
| 3 | FT_OTP | R | 0 | Junction over-temperature fault bit. 0 = no fault 1 = fault |
| 2 | FT_TO | R | 0 | Flash time-out indicator bit. 0 = no fault 1 = fault |
| 1 | FT_TX | R | 0 | TX high indicator bit. 0 = no fault 1 = fault |
| 0 | FT_IDC | R | 0 | Input DC current limit fault bit. 0 = no fault 1 = fault |

Table 17: Fault Indication and Blink Time Setting Register

| Addr: 0x0F | | | | |
|------------|-----------|--------|---------|--|
| Bit | Bit Name | Access | Default | Description |
| 7:6 | TBK | R/W | 01 | Blinking time setting bits in indicator mode. 00: no blinking, LED remains on 01: Tblink = 128ms 10: Tblink = 256ms 11: Tblink = 512ms |
| 5:4 | NA | R | NA | Reserved. |
| 3 | NA | R | NA | Reserved. |
| 2 | Ready_5V | R | 0 | 1: 5V Mode Ready, real-time indicates the status 0: no 5V Mode |
| 1 | FT_LEDHOT | R | 0 | NTC fault bit. 0 = no fault 1 = fault |
| 0 | FT_LEDOP | R | 0 | LED open fault bit. 0 = no fault 1 = fault |

APPLICATION INFORMATION

Selecting the Input Capacitor

The input capacitor reduces the surge current drawn from the input supply and the switching noise from the device. The input capacitor impedance at the switching frequency should be less than the input source impedance to prevent the high-frequency switching current from passing through to the input. Ceramic capacitors with X5R or X7R dielectrics are recommended for their low ESR and small temperature coefficients. A capacitor with a higher value can help reduce input voltage ripple and noise. For most applications, a 10µF ceramic capacitor is sufficient.

Selecting the Inductor

The converter requires an inductor to supply a higher output voltage while being driven by the input voltage. An inductor with a larger value results in less ripple current, a lower peak inductor current, and reduced stress on the internal N-channel MOSFET, but also has a larger physical size, higher series resistance, and lower saturation current.

Choose an inductor that does not saturate under the worst-case load conditions. Select the minimum inductor value to ensure that the boost converter works in continuous conduction mode with high efficiency and good EMI performance. Calculate the required inductance value using Equation (2) and Equation (3):

$$L \geq \frac{\eta \times V_{OUT} \times D \times (1-D)^2}{2 \times f_{SW} \times I_{LOAD}} \quad (2)$$

$$D = 1 - \frac{V_{IN}}{V_{OUT}} \quad (3)$$

Where V_{IN} and V_{OUT} are the input and output voltages, f_{SW} is the switching frequency, I_{LOAD} is the LED load current, and η is the efficiency.

The switching current is used for peak-current mode control. To avoid hitting the current limit, the worst-case inductor peak current should be less than 80% of the current-limit (I_{LIM}). For most applications, a 0.47µH~2µH inductor is sufficient.

Selecting the Output Capacitor

The output capacitor keeps the output voltage ripple small and ensures feedback loop stability. The output capacitor impedance must be low at the switching frequency. Ceramic capacitors with X7R dielectrics are recommended for their low ESR characteristics. Ensure that the ceramic capacitance is dependent on the voltage rating. The DC bias voltage and the value can lose as much as 50% of their capacitance at the rated voltage rating. Ensure that enough of a voltage rating margin is left when selecting the component. A capacitance that is too low can cause loop instability. For most applications, a 10µF ceramic capacitor is sufficient.

PCB Layout Guidelines

Efficient PBC layout is critical for stable operation. For best results, follow the guidelines below.

1. Place a ceramic capacitor close to VIN.
2. Use a wider copper wire for input, output, and GND to improve thermal performance.
3. Put as many vias close to GND at the output and input capacitors as possible to improve thermal performance.
