EV1530-Q-00A

Triple Output Step-Up Plus Charge Pump for TFT Bias

DESCRIPTION

The EV1530-Q-00A evaluation board is designed to demonstrate the capabilities of MPS' MP1530 triple output step-up converter which is capable of powering a TFT panel from a regulated 3.3V or 5V.

The MP1530 includes a 1.4MHz fixed-frequency step-up converter and a positive and negative linear regulator. The linear regulators are powered from a charge-pump driven by the step-up converter switch node (SW).

A single on/off control enables all 3 outputs. The outputs are internally sequenced at power on and power off for ease of use. An internal soft-start prevents overloading the input source at startup. Cycle-by-cycle over current protection limits component overstress.

ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	V_{IN}	2.7 – 5.5	V
Output Voltage 1	V_{MAIN}	+13	V
Output Current 1	I_{MAIN}	350	mA
Output Voltage 2	V_{GH}	+27	V
Output Current 2	I_{GH}	20	mA
Output Voltage 3	V_{GL}	–8.5	V
Output Current 3	I_{GL}	20	mA

FEATURES

- 2.7 to 5.5V Operating Input Range
- 2.8A Switch Current Limit
- 3 Outputs In Single Package
  - Step-Up Converter up to 22V
  - Positive 20mA Linear Regulator
  - Negative 20mA Linear Regulator
- 250mΩ Internal Power MOSFET Switch
- Up to 95% Efficiency
- 1μA Shutdown Mode
- Fixed 1.4MHz Frequency
- Positive Regulator up to 38V
- Negative Regulator down to –20V
- Internal Power-On Sequencing
- Adjustable Soft-Start/Fault Timer
- Thermal Shutdown
- Cycle-by-Cycle Over Current Protection
- Under Voltage Lockout
- Ready Flag

APPLICATIONS

- TFT LCD Displays
- Portable DVD Players
- Tablet PCs
- Car Navigation Displays

QUICK START GUIDE

The three output voltages of this board are set to +13V, +27V, and –8.5V. The board layout accommodates most commonly used inductors and output capacitors.

1. Attach the positive end of loads to the VMAIN, VGH and GND (for the negative output) pins, respectively. Attach negative ends of the loads to GND and VGL (for the negative output) pins.
2. Attach an input voltage 2.7V ≤ V_{IN} ≤ 5.5V and input ground to the VIN and GND pins, respectively.
3. The demo board starts up automatically once V_{IN} is applied due to the pull-up resistor R1. To disable the MP1530 connect the EN pin to ground.
4. During startup $\overline{RDY}$ will be left HIGH. Once the turn-on sequence is complete, this pin will be pulled LOW if all regulators exceed 80% of their specified voltages. After all regulators are turned-on, a fault in any regulator will cause $\overline{RDY}$ to go HIGH after approximately 15μs. If the fault persists for more than approximately 6ms (for CT=10nF), the entire chip will shut down.
5. To adjust the output voltages:

   Use a 10kΩ to 50kΩ for the low-side resistor of each voltage divider (i.e. R7, R9 and R5).

   V_{FB1} = V_{FB3} = V_{REF} = 1.25V.

   For the step-up converter, determine the high-side resistor R6 using the equation:

$$R6 = \frac{V_{MAIN} - V_{FB1}}{\left(\frac{V_{FB1}}{R7}\right)}$$

   Where V_{MAIN} is the output voltage of the step-up converter.

   For the positive charge-pump, determine the high-side resistor R8 by the equation:

$$R8 = \frac{V_{GH} - V_{FB3}}{\left(\frac{V_{FB3}}{R9}\right)}$$

   Where V_{GH} is the output voltage of the positive linear regulator. Determine the number of positive charge pump stages (N_{POS}) by:

$$N_{POS} = \frac{V_{GH} + V_{DROPOUT} - V_{MAIN}}{V_{MAIN} - 2V_D}$$

   Use $V_{DROPOUT}$ = 1V and V_D = 0.4V for Schottky diodes.

   For the negative charge-pump, determine the high-side resistor R4 by the equation:

$$R4 = \frac{-V_{GL}}{\left(\frac{V_{REF}}{R5}\right)}$$

   Where V_{GL} is the output voltage of the negative linear regulator. Determine the number of negative charge pump stages (N_{NEG}) by:

$$N_{NEG} = \frac{-V_{GL} + V_{DROPOUT}}{V_{MAIN} - 2V_D}$$

6. Use $V_{DROPOUT}$ = 0.3V and V_D = 0.4V for Schottky diodes.
