

EV2700-C-00A

26V, 1A, Linear Charger with Configurable JEITA Evaluation Board

DESCRIPTION

The EV2700-C-00A is an evaluation board designed to demonstrate the capabilities of the MP2700, a 26V, 1A, highly integrated linear charger for Li-ion or Li-polymer batteries.

The MP2700 has a dedicated ISET pin to set the charge current (I_{CC}) by connecting a resistor from this pin to ground. The USBM pin sets the input current limit (I_{IN_LIM}) prior to setting I_{CC} . The MP2700 also has a minimum input voltage limit (V_{IN_LIM}) to reduce I_{CC} when the input power is overloaded.

The MP2700 has an open-drain CHG pin to indicate the charge status, including charging, termination, and fault events.

The MP2700 supports a fully customizable JEITA profile with configurable temperature windows and actions.

The EV2700-C-00A supports an operating voltage up to 6V, and its absolute maximum input voltage (V_{IN}) can be up to 26V.

PERFORMANCE SUMMARY

Parameters	Conditions	Value
Input voltage (V_{IN}) range		4V to 6V
Battery charge regulation voltage (V_{BATT_REG})	$V_{IN} = 5V$	4.2V
Charge current (I_{CC})	$V_{BATT} = 4V$	0.02A to 1A

QUICK START GUIDE

The EV2700-C-00A evaluation board is designed for the MP2700 as a single-cell linear charger. Its layout accommodates most commonly used capacitors. The charge-full voltage is preset to 4.2V.

Table 1 lists the jumper set-ups for the EV2700-C-00A.

Table 1: Jumper Installations

Jumper	Description	Factory Setting
JP1	ISET resistor selection 1: $I_{CC} = 20\text{mA}$	Off
JP2	ISET resistor selection 2: $I_{CC} = 300\text{mA}$	Off
JP3	ISET resistor selection 3: $I_{CC} = 1\text{A}$	On
JP4	IPRE resistor selection 1: $I_{PRE} = 10\%$ of I_{CC}	On
JP5	IPRE resistor selection 2: $I_{PRE} = 20\%$ of I_{CC}	Off
JP6	External USBM pin control	Low
JP7	NTC setting: fixed 10k Ω pull-down	On
JP8	/CHG pull-up	On

Start-Up Procedure

To set up the EV2700-C-00A, refer to Figure 1 on page 3 and follow the guidelines below:

- Set the battery simulator output to be between 0V and 4.2V with a current limit at 3A, then turn off the battery simulator output.
- Set the DC power source to 5V with an output current limit at 2A, then turn off the DC power source.
- Connect the battery simulator terminals to:
 - Positive (+): VBATT
 - Negative (-): GND
- Connect the DC power source terminals to:
 - Positive (+): VIN
 - Negative (-): GND
- Set the fast charge current using JP1, JP2, and JP3.
- Set the pre-charge current using JP4 and JP5.
- Set the input current limit (I_{IN_LIM}) using JP6 (USBM). Connect JP6 to logic low to follow the ISET setting. Connect JP6 to logic high to set I_{IN_LIM} to 500mA. Float JP6 to set I_{IN_LIM} to 100mA. If connecting JP6 to logic high, an external 3V pull-up voltage must be connected between EXT_PU and GND on the board.
- Turn on the battery simulator.
- Turn on the DC power source. The IC should start up automatically.
