

EVL1608-TL-00A

5.5V, 6A, Synchronous Step-Down Converter in SOT583 Package Evaluation Board

DESCRIPTION

The EVL1608-TL-00A evaluation board is designed to demonstrate the capabilities of the MP1608, a monolithic, step-down, switch-mode converter with built-in internal power MOSFETs.

The MP1608 can achieve up to 6A of continuous output current (I_{OUT}) from a 2.4V to 5.5V input voltage (V_{IN}) range, with excellent load and line regulation. The output voltage (V_{OUT}) can be regulated to as low as 0.4V.

Constant-on-time (COT) control provides fast transient response, easy loop design, and tight output regulation.

Full protection features include over-current protection (OCP), current limiting with hiccup mode, and thermal shutdown.

The MP1608 requires a minimal number of readily available, standard external components, and is available in an ultra-small SOT583 package.

PERFORMANCE SUMMARY

Specifications are at $T_A = 25^\circ\text{C}$, unless otherwise noted.

QUICK START GUIDE

The EVL1608-TL-00A evaluation board is easy to set up and use to evaluate the performance of the MP1608. For proper measurement equipment set-up, refer to Figure 1 and follow the steps below:

1. Preset the power supply to 5V, then turn off the power supply. ⁽¹⁾
2. Connect the power supply terminals to:
 - a. Positive (+): VIN
 - b. Negative (-): GND
3. Connect the load terminals to:
 - a. Positive (+): VOUT
 - b. Negative (-): GND
4. After making the connections, turn on the power supply. The board should automatically start up.
5. Check for the proper output voltage (V_{OUT}) between the VOUTSENSE and GNDSENSE terminals.
6. Once the proper V_{OUT} is established, adjust the load within the operating range and measure the efficiency, V_{OUT} ripple, and other parameters. ⁽²⁾
7. After completing all tests, adjust the load to 0A, then turn off the input power supply.

Notes:

- 1) Ensure that V_{IN} does not exceed 5.5V.
- 2) When measuring the V_{OUT} or V_{IN} ripple, do not use the long ground lead on the oscilloscope probe.

Notes:

- 3) If $V_{IN} < 3.3V$, greater input capacitance may be required.
