

EVM54313-BJ-00A

16V, 3A Triple-Output, Power Module with an I²C Interface Evaluation Board

DESCRIPTION

The EVM54313-BJ-00A evaluation board is designed to demonstrate the capabilities of the MPM54313, a triple-output, fully integrated power module with an I²C interface. Each output can support 3A, for a total of 9A. The MPM54313 offers a complete power solution with built-in, on/off sequencing control, configurable soft start (SS), compensation, and various protection thresholds.

The MPM54313 offers configurable active voltage positioning (AVP) to generate a droop voltage that allows three outputs to operate in parallel with passive current balancing. In addition, two of the outputs can operate in parallel for up to 6A in interleaving mode, which allows for active current balancing.

Constant-on-time (COT) control provides ultra-fast transient response. A 1MHz switching frequency (f_{sw}) greatly reduces the external inductor and capacitor size. Full protection features include under-voltage lockout (UVLO), over-current protection (OCP), over-voltage protection (OVP), under-voltage protection (UVP), and thermal shutdown.

The MPM54313 is available in a BGA (8mmx9mmx2.58mm) package. It is recommended to read the MPM54313 datasheet prior to making any changes to the EVM54313-BJ-00A.

PERFORMANCE SUMMARY ⁽¹⁾

Specifications are at $T_A = 25^{\circ}\text{C}$.

Parameters	Conditions	Value
Input voltage (V_{IN}) range		4V to 16V ⁽²⁾
Output voltage (V_{OUT}) ⁽³⁾	$V_{IN} = 4\text{V to } 16\text{V}$, $I_{OUT} = 0\text{A to } 3\text{A}$	3.36V
Maximum output current (I_{OUT})	$V_{IN} = 4\text{V to } 16\text{V}$	9A
Full load efficiency	$V_{IN} = 12\text{V}$, $V_{OUT} = 3.3\text{V}$, $I_{OUT} = 3\text{A}$, $f_{sw} = 750\text{kHz}$, independent output	91.04%
Peak efficiency	$V_{IN} = 12\text{V}$, $V_{OUT} = 3.3\text{V}$, $I_{OUT} = 2.5\text{A}$, $f_{sw} = 750\text{kHz}$, independent output	91.12%
Default switching frequency (f_{sw})		1000kHz

Notes:

- 1) For different V_{IN} and V_{OUT} specifications with different output capacitors and inductors, the application circuit parameters may require changes.
- 2) When $V_{IN} < 4\text{V}$, the enable (EN) resistor divider value must be changed.
- 3) V_{OUT} is adjustable via an internal or external 0.5V to 5.5V resistor divider range.

QUICK START GUIDE

The EVM54313-BJ-00A evaluation board is easy to set up, and it can evaluate the MPM54313's performance. For the proper measurement equipment set-up, refer to Figure 1 and follow the steps below.

- For independent outputs, connect the load terminals to:
 - Positive (+): VOx (including VOA, VOB, and VOC)
 - Negative (-): GND
- For multi-phase outputs, connect VOx first.
- Preset the power supply output to be between 4V and 16V, then turn off the power supply. ⁽⁴⁾
- Connect the power supply output terminals to:
 - Positive (+): VIN
 - Negative (-): GND
- After making the connections, turn on the power supply and EN switch. The board should automatically start up. ⁽⁵⁾

Figure 1 shows the proper measurement equipment set-up.

Notes:

- Ensure that V_{IN} does not exceed 16V.
- When measuring the V_{OUT} or V_{IN} ripple, do not use the oscilloscope probe's long ground lead.

Figure 1: Proper Measurement Equipment Set-Up

Virtual Bench Pro 3.0 Evaluation Software

1. Connect the hardware (see Figure 2).

Figure 2: Hardware Set-Up

2. To set up the software with the MPM54313, open Virtual Bench Pro 3.0 to scan the connected power modules. ⁽⁶⁾
3. If the GUI detects the power module, then an address should appear next to “MPM54313” on the left panel (e.g. 0x0F), and the indicator to the left should turn green (see Figure 3).

Figure 3: Successful Connection

Note:

- 6) For more details on using the Virtual Bench GUI, refer to the documentation provided with the GUI download files.

- The Register Control menu should appear in the middle panel (marked in red), and the values stored in the module registers should be read automatically (see Figure 4).

Figure 4: The Register Control Menu

- Change the register values to their required value. A valid input must be entered; otherwise, an alert appears and the entered value is not accepted (see Figure 5).

Figure 5: Modify the Register Values

6. Click the “Write to Chip” button to modify the register.
7. Click the “Write to MTP” button and wait until the writing action completes (see Figure 6).

Figure 6: Writing to the MTP

8. Turn off the power supply.
9. Wait three seconds, and then turn on the power supply. The new configuration should take effect.

EVB TEST RESULTS

Performance curves and waveforms are tested on the evaluation board. $V_{IN} = 12V$, $V_{OUT} = 3.3V$, $f_{SW} = 1000kHz$, $T_A = 25^{\circ}C$, unless otherwise noted.

Thermal Performance of a Three-Phase Single Output in Parallel

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, $f_{SW} = 100kHz$, $I_{OUT} = 9A$, no forced airflow, $T_A = 26.7^{\circ}C$, $T_{CASE} = 81.5^{\circ}C$

EVB TEST RESULTS (continued)

$V_{IN} = 12V$, $T_J = -40^{\circ}C$ to $+125^{\circ}C$, typical value is tested at $T_J = 25^{\circ}C$, the over-temperature limit is guaranteed by characterization, unless otherwise noted.

Steady State

$V_{IN} = 12V$, $V_{OUT} = 1V$, $I_{OUT} = 0A$,
 $C_{OUT} = 3 \times 22\mu F$, voltage ripple = 4.6mV,
 single-channel

1μs/div.

Steady State

$V_{IN} = 12V$, $V_{OUT} = 1V$, $I_{OUT} = 3A$,
 $C_{OUT} = 3 \times 22\mu F$, voltage ripple = 5.6mV,
 single-channel

1μs/div.

Steady State

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, $I_{OUT} = 0A$,
 $C_{OUT} = 3 \times 22\mu F$, voltage ripple = 15.8mV,
 single-channel

1μs/div.

Steady State

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, $I_{OUT} = 3A$,
 $C_{OUT} = 3 \times 22\mu F$, voltage ripple = 16.4mV,
 single-channel

1μs/div.

Load Transient

$V_{IN} = 12V$, $V_{OUT} = 1V$, $I_{OUT} = 0A$ to 0.75A,
 slew rate = 10A/μs, $C_{OUT} = 3 \times 22\mu F$, single-channel

200μs/div.

Load Transient

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, $I_{OUT} = 0A$ to 0.75A,
 slew rate = 10A/μs, $C_{OUT} = 3 \times 22\mu F$, single-channel

200μs/div.

EVB TEST RESULTS (continued)

$V_{IN} = 12V$, $T_J = -40^{\circ}C$ to $+125^{\circ}C$, typical value is tested at $T_J = 25^{\circ}C$, the over-temperature limit is guaranteed by characterization, unless otherwise noted.

Steady State

$V_{IN} = 12V$, $V_{OUT} = 1V$, $I_{OUT} = 0A$,
voltage ripple = 3.1mV, three outputs in parallel

Steady State

$V_{IN} = 12V$, $V_{OUT} = 1V$, $I_{OUT} = 9A$,
voltage ripple = 3.5mV, three outputs in parallel

Steady State

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, $I_{OUT} = 0A$,
voltage ripple = 5.8mV, three outputs in parallel

Steady State

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, $I_{OUT} = 9A$,
voltage ripple = 6.2mV, three outputs in parallel

Load Transient

$V_{IN} = 12V$, $V_{OUT} = 1V$, $I_{OUT} = 0A$ to 2.25A,
slew rate = 10A/μs, $C_{OUT} = 9 \times 22\mu F$,
three outputs in parallel

Load Transient

$V_{IN} = 12V$, $V_{OUT} = 3.3V$, $I_{OUT} = 0A$ to 2.25A,
slew rate = 10A/μs, $C_{OUT} = 9 \times 22\mu F$,
three outputs in parallel
