EVQ2179B-QH-00A

3A, 6V, 710kHz, Synchronous Step-Down Converter Evaluation Board, AEC-Q100 Qualified

DESCRIPTION

The EVQ2179B-QH-00A is an evaluation board designed to demonstrate the capabilities of the MPQ2179BGQHE-AEC1, a monolithic, step-down switch-mode converter with built-in internal power MOSFETs.

The MPQ2179B achieves 3A of output current (I_{OUT}) from a 2.5V to 6V input voltage (V_{IN}) range, with excellent load and line regulation. The output voltage (V_{OUT}) can be regulated to as low as 0.5V. A 100% maximum duty cycle can be reached in low-dropout (LDO) mode.

Constant-on-time (COT) control offers a simpler control loop and faster transient response. By using V_{IN} feed-forward, the MPQ2179B maintains a nearly constant switching frequency (f_{SW}) across the input and load ranges. Forced continuous conduction mode (FCCM) provides a stable frequency and a lower output ripple.

An open-drain power good (PG) signal indicates a nominal voltage after the soft-start time. PG pulls high if the feedback voltage (V_{FB}) reaches 90% of the reference voltage (V_{REF}); PG pulls to GND when V_{FB} drops to 84% of V_{REF}.

Full protection features include cycle-by-cycle current limiting, short-circuit protection (SCP), reliable over-voltage protection (OVP), and thermal protection with automatic recovery.

The EVQ2179B-QH-00A is a fully assembled and tested evaluation board. The MPQ2179B is available in a QFN-8 (1.5mmx2mm) package, and it is available in AEC-Q100 Grade 1.

PERFORMANCE SUMMARY

Specifications are at T_A = 25°C, unless otherwise noted.

Parameters	Conditions	Value
Input voltage (V_{IN}) range		2.5V to 6V
Output voltage (V_{OUT})	V_{IN} = 2.5V to 6V, I_{OUT} = 0A to 3A	0.5V
Maximum output current (I_{OUT})	V_{IN} = 2.5V to 6V	3A
Typical efficiency	V_{IN} = 3.3V, V_{OUT} = 0.5V, I_{OUT} = 3A	69%
Peak efficiency	V_{IN} = 2.5V, V_{OUT} = 0.5V, I_{OUT} = 0.3A	88.1%
Switching frequency (f_{SW})		710kHz

QUICK START GUIDE

The EVQ2179B-QH-00A evaluation board is easy to set up and use to evaluate the MPQ2179B's performance. For proper measurement equipment set-up, refer to Figure 2 on page 4 and follow the steps below:

1. Preset the power supply (V_{IN}) between 2.5V and 6V, then turn off the power supply.
2. Set the load current between 0A and 3A. Electronic loads represent a negative impedance to the regulator, and setting a current too high may trigger cycle-by-cycle over-current protection (OCP).
3. If longer cables (>0.5m total) are used between the source and the evaluation board, place a damping capacitor at the input terminals.
4. Connect the power supply terminals to:
   a. Positive (+): VEMI
   b. Negative (-): GND
5. Connect the load terminals to:
   a. Positive (+): VOUT
   b. Negative (-): GND
6. After making the connections, turn on the power supply.
7. To use the enable function, apply a digital input to the EN pin. Drive EN above 0.9V to turn the regulator on; drive EN below 0.65V to turn the regulator off. If the enable function is not used, EN can be connected directly to VIN.
8. The external resistor divider sets the output voltage (V_{OUT}) (see Figure 1).

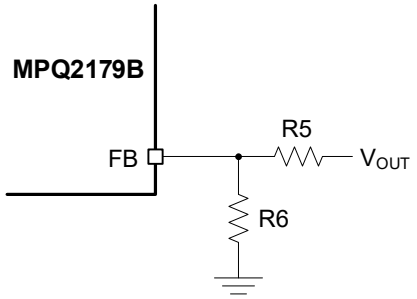

Figure 1: Feedback Divider Network with Adjustable Output

R5 is selected to be between 10kΩ and 100kΩ. R6 can then be calculated with Equation (1):

$$R6 = \frac{R5}{\frac{V_{OUT}}{0.5} - 1} \quad (1)$$

For a 0.5V V_{OUT}, R5 should be 0Ω, and R6 should be NS.

Refer to the Application Information section in the MPQ2179B's datasheet to calculate the inductance and output capacitance for different V_{OUT} values. Figure 2 on page 4 shows the proper measurement equipment set-up.
