

EVQ4321-D-00A

36V, 1A, Low- I_Q , Synchronous Step-Down Converter in a QFN-12 Package Evaluation Board, AEC-Q100 Qualified

DESCRIPTION

The EVQ4321-D-00A evaluation board is designed to demonstrate the capabilities of the MPQ4321, a 350kHz to 2.5MHz configurable-frequency, synchronous, step-down switching regulator with integrated, internal high-side MOSFETs (HS-FETs) and low-side MOSFETs (LS-FETs).

The MPQ4321 provides 1A of highly efficient output current (I_{OUT}) with peak current control mode. The wide 3.3V to 36V input voltage (V_{IN}) range and 42V load dump tolerance accommodates a variety of step-down applications in automotive input environments. A 1 μ A quiescent current (I_Q) in shutdown mode allows the device to be used in battery-powered applications.

High power conversion efficiency across a wide load range is achieved by scaling down the

switching frequency (f_{SW}) under light-load conditions, which reduces the switching and gate driver losses.

An open-drain power good (PG) signal indicates whether the output is within 94.5% to 105.5% of its nominal voltage.

Frequency foldback helps prevent inductor current (I_L) runaway during start-up. Thermal shutdown provides reliable, fault-tolerant operation. A high duty cycle and low-dropout (LDO) mode are provided for automotive cold-crank conditions.

The EVQ4321-D-00A is fully assembled and tested. The MPQ4321 is available in a QFN-12 (2mmx3mm) package with wettable flanks. It is available in AEC-Q100 Grade 1.

PERFORMANCE SUMMARY

Specifications are at $T_A = 25^\circ\text{C}$, unless otherwise noted.

Parameters	Conditions	Value
Input voltage (V_{IN}) range		3.3V to 36V
Output voltage (V_{OUT})	$V_{IN} = 6\text{V to } 36\text{V}$, $I_{OUT} = 0\text{A to } 1\text{A}$	$V_{OUT} = 5\text{V}$
Maximum output current (I_{OUT})	$V_{IN} = 3.3\text{V to } 36\text{V}$	1A
Typical efficiency	$V_{IN} = 12\text{V}$, $V_{OUT} = 5\text{V}$, $I_{OUT} = 1\text{A}$	92.6%
Peak efficiency	$V_{IN} = 8\text{V}$, $V_{OUT} = 5\text{V}$, $I_{OUT} = 1\text{A}$	94.4%
Switching frequency (f_{SW})		2.2MHz

QUICK START GUIDE

The EVQ4321-D-00A evaluation board is easy to set up and use to evaluate the MPQ4321's performance. For proper measurement equipment set-up, refer to Figure 2 on page 4 and follow the steps below:

1. Preset the power supply between 6V and 36V, then turn off the power supply.
2. Set the load current between 0A and 1A. Electronic loads represent a negative impedance to the regulator, and setting a current too high may trigger hiccup mode.
3. If longer cables are used between the source and the evaluation board (>0.5m total), place a damping capacitor at the input terminals, especially when $V_{IN} \geq 24V$.
4. Connect the power supply terminals to:
 - a. Positive (+): VEMI
 - b. Negative (-): GND
5. Connect the load terminals to:
 - a. Positive (+): VOUT
 - b. Negative (-): GND
6. After making the connections, turn on the power supply.
7. To use the enable function, apply a digital input to the EN pin. Drive EN above 1.02V to turn the regulator on; drive EN below 0.85V to turn the regulator off. If the enable function is not used, EN can be connected directly to VIN.
8. Connect a resistor between the FREQ and GND pins to set the internal switching frequency (f_{sw}), which ranges between 350kHz and 2.5MHz.
9. The external resistor divider sets the output voltage (V_{OUT}) (see Figure 1).

Figure 1: Feedback Divider Network with Adjustable Output

R5 is selected to be 100kΩ. R6 can then be calculated using Equation (1):

$$R6 = \frac{R5}{\frac{V_{OUT}}{0.8V} - 1} \quad (1)$$

Refer to the Application Information section in the MPQ4321 datasheet to calculate the inductance and output capacitance for different V_{OUT} values.
