

EVQ4334-L-4000-00A

36V, 4A, Low Quiescent Current, Synchronous
Step-Down Converter Evaluation Board
in QFN-12 (3mmx4mm), AEC-Q100 Qualified

DESCRIPTION

The EVQ4334-L-4000-00A is an evaluation board designed to demonstrate the capabilities of the MPQ4334GLE-4000-AEC1, a configurable-frequency (200kHz to 2.5MHz), synchronous, step-down switching converter with an integrated, internal high-side MOSFET (HS-FET) and low-side MOSFET (LS-FET).

The MPQ4334GLE-4000-AEC1 provides up to 4A of highly efficient output current (I_{OUT}) with peak current mode control. The wide 3V to 36V input voltage (V_{IN}) range and 40V load dump tolerance accommodates a variety of step-down applications in automotive input environments. A 0.5 μ A shutdown mode quiescent current (I_Q) allows the device to be used in battery-powered applications.

High power conversion efficiency across a wide load range is achieved by scaling down the switching frequency (f_{SW}) under light-load

conditions to reduce switching and gate driver losses.

An open-drain power good (PG) signal indicates whether the output voltage (V_{OUT}) is within 94.5% to 105.5% of its nominal voltage.

Frequency foldback helps prevent inductor current (I_L) runaway during start-up. Thermal shutdown provides reliable, fault-tolerant operation.

High duty cycle and low-dropout (LDO) mode are provided for automotive cold-crank conditions.

The EVQ4334-L-4000-00A is a fully assembled and tested evaluation board. The MPQ4334GLE-4000-AEC1 is available in a QFN-12 (3mmx4mm) package with wettable flanks, and is AEC-Q100 qualified.

PERFORMANCE SUMMARY

Specifications are at $T_A = 25^\circ\text{C}$, unless otherwise noted.

Parameters	Conditions	Value
Input voltage (V_{IN}) range		3V to 36V
Output voltage (V_{OUT})	$V_{IN} = 6\text{V to } 36\text{V}$, $I_{OUT} = 0\text{A to } 4\text{A}$	5V
Maximum output current (I_{OUT})	$V_{IN} = 3\text{V to } 36\text{V}$	4A
Typical efficiency	$V_{IN} = 12\text{V}$, $V_{OUT} = 5\text{V}$, $I_{OUT} = 4\text{A}$	91.5%
Peak efficiency	$V_{IN} = 8\text{V}$, $V_{OUT} = 5\text{V}$, $I_{OUT} = 1\text{A}$	96%
Switching frequency (f_{SW})		2.2MHz

EVQ4334-L-4000-00A EVALUATION BOARD

EVQ4334-L-4000-00A	MPQ4334GLE-4000-AEC1

QUICK START GUIDE

The EVQ4334-L-4000-00A evaluation board is easy to set up and use to evaluate the performance of the MPQ4334. For proper measurement equipment set-up, refer to Figure 2 on page 4 and follow the steps below:

1. Preset the power supply (V_{IN}) to be between 6V and 36V, then turn off the power supply.
2. Set the load current between 0A and 4A. Electronic loads represent a negative impedance to the regulator, and setting the current too high can trigger hiccup mode.
3. If longer cables (>0.5m total) are used between the source and the evaluation board, place a damping capacitor at the input terminals (especially when $V_{IN} \geq 24V$).
4. Connect the power supply terminals to:
 - a. Positive (+): VEMI
 - b. Negative (-): GND
5. Connect the load terminals to:
 - a. Positive (+): VOUT
 - b. Negative (-): GND
6. After making the connections, turn on the power supply. The board should start up automatically.
7. To use the enable (EN) function, apply a digital input to the EN pin. Pull EN above 1.02V to turn the regulator on; pull EN below 0.85V to turn it off. If the enable function is not used, EN can be connected directly to VIN.
8. Connect a resistor between the FREQ and GND pins to set the internal switching frequency (f_{SW}).
9. Set the output voltage (V_{OUT}) using the external resistor divider (see Figure 1).

Figure 1: Feedback Divider Network with Adjustable Output

R_5 should be 100k Ω . Then R_6 can be calculated with Equation (1):

$$R_6 = \frac{R_5}{\frac{V_{OUT}}{0.8V} - 1} \quad (1)$$

Refer to the Application Information section in the MPQ4334 datasheet to calculate the inductance (L) and output capacitance (C_{OUT}) for different output voltages.

Note:

1) MPS custom-produces these pins. Contact an MPS FAE for more information.

EVB TEST RESULTS

Performance curves and waveforms are tested on the evaluation board, $V_{IN} = 12V$, $V_{OUT} = 5V$, $T_A = 25^\circ C$, unless otherwise noted.

Input Current vs. Load Current for 4000 Version

$R_{FB1} = 100k\Omega$, $R_{FB2} = 19.1k\Omega$,
DCR = 22.1m Ω

Efficiency vs. Load Current for 4000 Version

$R_{FB1} = 100k\Omega$, $R_{FB2} = 19.1k\Omega$,
DCR = 22.1m Ω

Efficiency vs. Load Current for 4000 Version

DCR = 22.1m Ω

Efficiency vs. Load Current for 4000 Version

DCR = 22.1m Ω

Load Regulation for 4000 Version

DCR = 22.1m Ω

Line Regulation for 4000 Version

DCR = 22.1m Ω

EVB TEST RESULTS *(continued)*

Performance curves and waveforms are tested on the evaluation board, $V_{IN} = 12V$, $V_{OUT} = 5V$, $T_A = 25^\circ C$, unless otherwise noted.
