**DESCRIPTION**

HF81 is an innovative two-terminal IC that automatically discharges an X capacitor while eliminating power losses and allowing power supplies to comply with safety standards.

The HF81 acts as a smart high-voltage switch when placed in series with discharge resistors (alternatively bleed resistors). In the presence of an AC voltage, the HF81 blocks current flow in the safety discharge resistors to reduce the power loss in these components to zero at 230 VAC. When disconnected from the AC voltage, the HF81 automatically and safely discharges the X capacitor by closing the circuit through the bleed resistors and directing the energy away from the exposed AC plug.

**FEATURES**

- Disconnect series discharge resistors from L-N when AC voltage is applied
- Connect series discharge resistors with L-N to discharge the X capacitor when AC voltage is unplugged
- Supplied by AC voltage directly and doesn’t need external bias
- Meets safety standards for use before or after input fuse
- No external ground pin leads to high common mode surge immunity
- 1000V internal JFET inside leads to high differential surge immunity
- >4mm creepage on package and PCB
- Compliant to IEC 60950-1

**APPLICATIONS**

- AC/DC converters with X capacitors larger than 0.1μF
- All converters requiring ultra-low no-load consumption and low standby power
- Appliances requiring EuP Lot 6 compliance
- Appliances requiring Energy Star V2.0
- White Goods (For example, Dishwasher, Washing Machine, Air-Conditioner and etc.)
- Server Power, Telecom Power, ATX Power

PACKAGE REFERENCE

ABSOLUTE MAXIMUM RATINGS

- L1-L2 Pin Voltage: 1000V
- Storage Temperature: -65°C to 150°C
- Lead Temperature: 260°C
- Continuous Power Dissipation ($T_A = +25^\circ C$): 1.4W
- Single Avalanche Energy: 70μJ
- Avalanche Current: 80mA
- Junction Temperature: 150°C

Recommended Operating Conditions

- Operating Junction Temp. ($T_J$): -40°C to +125°C

Thermal Resistance

<table>
<thead>
<tr>
<th>Package</th>
<th>$\theta_JA$</th>
<th>$\theta_JC$</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOIC8</td>
<td>90</td>
<td>45</td>
</tr>
</tbody>
</table>

Notes:

2) Exceeding these ratings may damage the device.
3) The maximum allowable power dissipation is a function of the maximum junction temperature $T_J$ (MAX), the junction-to-ambient thermal resistance $\theta_{JA}$, and the ambient temperature $T_A$. The maximum allowable continuous power dissipation at any ambient temperature is calculated by $P_D$ (MAX) = ($T_J$ (MAX) - $T_A$)/$\theta_{JA}$. Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
4) $L=5mH$, $Vgs=10V$, $V_{DD}=1.4V$
5) The device is not guaranteed to function outside of its operating conditions.
6) Measured on JESD51-7, 4-layer PCB.
ELECTRICAL CHARACTERISTICS

$T_A = 25°C$, unless otherwise noted.

OPERATION

A smart bleeder normally works as an off device: It consumes very little current, it always monitors the AC line for zero crossings; whenever it detects a zero crossing it discharges the timer capacitor and resets the latch circuit.

Whenever a prolonged period occurs without a zero crossing (meaning the power supply unit [PSU] was unplugged from the utility line), the timer block times out and triggers the latch circuit. The latch circuit turns on the discharging transistors, as shown by the timing diagram in Figure 1. The internal transistor enables the bleeder resistors, and stops when either the voltage across the HF81 drops below 10V or the PSU is plugged back into the utility line. This operation allows for more X capacitor choices and reduces the inductor cost.

Carefully select a metal oxide varistor (MOV) and fuse to meet safety requirements: The MOV supresses voltage transients. During normal operation, a MOV with high impedance permits only a small current. When a voltage surge occurs, the MOV resistance reduces to a few Ωs, which allows the large surge current to flow through while protecting other devices in parallel to it.

There are several parameters for selecting a MOV, including maximum-allowable voltage, maximum clamping voltage, and the MOV max endured energy. The maximum-allowable voltage must exceed the maximum working voltage by 10%, 20% or the circuit needs an even higher derating, which is determined by the power source stability. After selecting a MOV, verify it using \( V_{\text{lmA}} \), which is the voltage across the MOV the current is 1mA. Simplified, this is:

\[
V_{\text{lmA}} = 1.5V_{\text{peak}} = 2.2V_{\text{AC}} \quad (1)
\]

Where \( V_{\text{peak}} \) is the peak working voltage and \( V_{\text{AC}} \) is the rms working voltage.

Also, please make sure the breakdown voltage of other components on the AC side fall below the maximum allowable voltage.

Base MOV size selection on MOV withstanding transient energy. Calculate the energy using formula 2.

\[
W = K \times V_{\text{Clamp}} \times I_{\text{Peak}} \times t \quad (2)
\]

Where \( K \) is a constant 1.0 for rectangular waveform and 1.4 for 8/20µs and 10/1000µs waveform, \( V_{\text{Clamp}} \) is the maximum clamping voltage, and \( I_{\text{Peak}} \) is the peak applied current. Make sure that the calculated energy is lower than the rated energy on the MOV datasheet. Select the fuse based on MOV specification.

Generally, select the fuse based on MOV diameter as per Table 2.

**Figure 2: HF81 Position Selection**
HF81 Position Selection

Figure 2 shows a typical front-end configuration of offline products. The configuration influences the position selection for the HF81.

Large currents flow through the MOV whenever a voltage surge occurs, which can cause significant voltage drops across inductive EMI components and traces. Place the HF81 as close as possible to the MOV.

1. For MOV in position 1, place the HF81 directly underneath the X cap.
2. For MOV in position 2, place the HF81 on the same side and physically close to MOV. If the HF81 cannot be placed at the same side as the MOV, make sure the surge level no higher than 1.5kV.
3. For surge levels higher than 1.5kV, place the HF81 and MOV on the same side as the inductive EMI components.

X capacitor can be placed before the input fuse. In this case, if the value of the X capacitor exceeds 0.1 μF; to meet safety requirements, place the HF81 in front of the input fuse. Also, place the MOV before the input fuse if surge voltage is >1.5kV.

PCB Layout and Discharge Resistor Selection

Figure 3 shows the typical PCB layout of the HF81. The discharge resistors are divided into two separate surface mount resistors. Resistors R1 and R2 need to be rated for 50% power dissipation and voltage rating in order to dissipate loss and withstand the input voltage under a short between the L1 and L2 terminals of the HF81.

If the application needs lower power rating or voltage rating discharge resistor, the discharge resistor can be divided more discrete resistors though the total external resistance must be equal to the values specified in Table 1.

Safety Consideration

To satisfy safety requirements, the HF81 has double pins for each terminal for design redundancy. During a single point failure test, if one pin is physically disconnected to the part or PCB, the HF81 continues to function normally. If one pin of part shorts to another at an opposite terminal, the HF81 shorts and is equivalent to a system without the HF81, which is also safe.

Table 3 summaries the results of single-point failure testing. Under open or short conditions, the HF81 has a null effect on power systems compared to systems without the HF81.
