

### DESCRIPTION

The MP1518 is a step-up converter designed for driving up to 6 series white LEDs from a single cell Lithium Ion battery. The MP1518 uses current mode, fixed frequency architecture to regulate the LED current, which is measured through an external current sense resistor. Its low 104mV feedback voltage reduces power loss and improves efficiency. The OV pin monitors the output voltage and turns off the converter if an over-voltage condition is present due to an open circuit condition.

The MP1518 includes under-voltage lockout, current limiting and thermal overload protection preventing damage in the event of an output overload.

The MP1518 is available in small 6-pin TSOT23 or 8-pin QFN (2mm x 2mm) packages.

Also available is the MP1518DJE, which has slightly slower switching slew rate, thus is ideal for applications where low EMI is critical.

### EVALUATION BOARD REFERENCES

Board Number	Dimensions
EV0056	1.9"X x 1.8"Y x 0.4"Z
EV1518DG-00A	2.0"X x 1.8"Y x 0.4"Z

### FEATURES

- On Board Power MOSFET
- Drives up to 6 Series White LEDs
- Up to 87% Efficiency
- Over 1MHz Fixed Switching Frequency
- Open Load Shutdown
- Low 104mV Feedback Voltage
- Soft-Start/PWM Dimming
- UVLO, Thermal Shutdown
- Internal Current Limit
- Available in TSOT23-6 and QFN8 Packages

### APPLICATIONS

- Cell Phones
- Handheld Computers and PDAs
- Digital Still Cameras
- Small LCD Displays

All MPS parts are lead-free and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are Trademarks of Monolithic Power Systems, Inc.

### TYPICAL APPLICATION

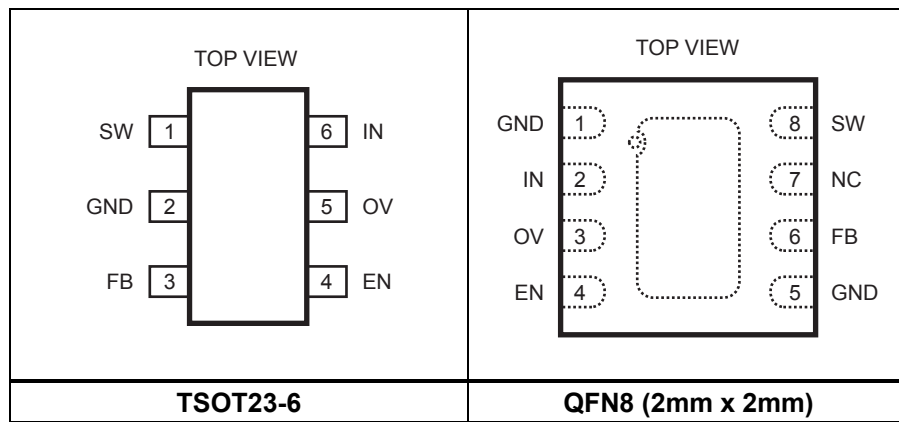

### ORDERING INFORMATION

Part Number	Package	Top Marking
MP1518DJ*	TSOT23-6	A8
MP1518DJE		F6
MP1518DG**	QFN8 (2x2mm)	A8

\* For Tape & Reel, add suffix -Z (e.g. MP1518DJ-Z);  
 For RoHS, compliant packaging, add suffix -LF (e.g. MP1518DJ-LF-Z).  
 \*\* For Tape & Reel, add suffix -Z (e.g. MP1518DG-Z);  
 For RoHS, compliant packaging, add suffix -LF (e.g. MP1518DG-LF-Z).

### PACKAGE REFERENCE

#### ABSOLUTE MAXIMUM RATINGS <sup>(1)</sup>

SW, OV Pins ..... -0.5V to +28V  
 All Other Pins ..... -0.3V to +6.5V  
 Continuous Power Dissipation ( $T_A = +25^\circ\text{C}$ ) <sup>(2)</sup>  
 TSOT23-6 ..... 0.57W  
 QFN8 (2x2mm) ..... 1.6W  
 Storage Temperature .....  $-55^\circ\text{C}$  to  $+150^\circ\text{C}$

#### Recommended Operating Conditions <sup>(3)</sup>

IN Supply Voltage ..... 2.5V to 6V  
 Output Voltage .....  $V_{IN}$  to 25V  
 Operating Junction Temp. ( $T_J$ ) .....  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$

#### Thermal Resistance <sup>(4)</sup> $\theta_{JA}$ $\theta_{JC}$

TSOT23-6 ..... 220 ..... 110 ..  $^\circ\text{C}/\text{W}$   
 QFN8 (2mm x 2mm) ..... 80 ..... 16 ...  $^\circ\text{C}/\text{W}$

#### Notes:

- Exceeding these ratings may damage the device.
- The maximum allowable power dissipation is a function of the maximum junction temperature  $T_J$  (MAX), the junction-to-ambient thermal resistance  $\theta_{JA}$ , and the ambient temperature  $T_A$ . The maximum allowable continuous power dissipation at any ambient temperature is calculated by  $P_D$  (MAX) =  $(T_J$  (MAX) -  $T_A$ ) /  $\theta_{JA}$ . Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- The device is not guaranteed to function outside of its operating conditions.
- Measured on JESD51-7, 4-layer PCB.

## ELECTRICAL CHARACTERISTICS

$V_{IN} = V_{EN} = 5V$ ,  $T_A = +25^\circ C$ , unless otherwise noted.

Parameters	Symbol	Condition	Min	Typ	Max	Units
Operating Input Voltage	$V_{IN}$		2.5		6	V
Supply Current (Shutdown)		$V_{EN} = 0V$		0.1	1	$\mu A$
Supply Current (Quiescent)		$V_{FB} = 0.15V$		690	750	$\mu A$
Switching Frequency	$f_{SW}$		1.0	1.3	1.5	MHz
Maximum Duty Cycle		$V_{FB} = 0V$	85	92		%
<b>Under Voltage Lockout</b>						
IN Under Voltage Lockout	UVLO	$V_{IN}$ Rising		2.25	2.45	V
Under Voltage Lockout Hysteresis				92		mV
Open Lamp Shutdown Threshold	$V_{OV}$	$V_{OV}$ Rising		28		V
<b>Enable</b>						
EN Threshold		$V_{EN}$ Rising	1.0	1.35	1.6	V
EN Threshold		$V_{EN}$ Rising, $V_{IN} = 2.5V$	0.8			V
EN Hysteresis				90		mV
EN Input Bias Current		$V_{EN} = 0V, 5V$			1	$\mu A$
<b>Feedback</b>						
FB Voltage			94	104	114	mV
FB Input Bias Current		$V_{FB} = 0.1V$	-600	-300		nA
<b>Output Switch</b>						
SW On-Resistance <sup>(5)</sup>	$R_{ON}$			0.5		$\Omega$
SW Current Limit <sup>(5)</sup>		Duty Cycle = 60%		350		mA
Thermal Shutdown <sup>(5)</sup>				160		$^\circ C$

**Notes:**

5) Guaranteed by design.

**PIN FUNCTIONS**

TSOT23-6 Pin #	QFN8 Pin #	Name	Pin Function
1	8	SW	Power Switch Output. SW is the drain of the internal MOSFET switch. Connect the power inductor and output rectifier to SW. SW can swing between GND and 25V.
2	1, 5	GND	Ground.
3	6	FB	Feedback Input. The MP1518 regulates the voltage across the current sense resistor between FB and GND. Connect a current sense resistor from the bottom of the LED string to GND. Connect the bottom of the LED string to FB. The regulation voltage is 104mV.
4	4	EN	Regulator On/Off Control Input. A high input at EN turns on the converter, and a low input turns it off. When not used, connect EN to the input source for automatic startup. <b>The EN pin cannot be left floating.</b>
5	3	OV	Over Voltage Input. OV measures the output voltage for open circuit protection. Connect OV to the output at the top of the LED string.
6	2	IN	Input Supply Pin. Must be locally bypassed.

**OPERATION**

The MP1518 uses a constant frequency, peak current mode boost regulator architecture to regulate the series string of white LEDs. The operation of the MP1518 can be understood by referring to the block diagram of Figure 1.

At the start of each oscillator cycle the FET is turned on through the control circuitry. To prevent sub-harmonic oscillations at duty cycles greater than 50 percent, a stabilizing ramp is added to the output of the current sense amplifier and the result is fed into the positive input of the PWM comparator. When this voltage equals the output voltage of the error amplifier the power FET is turned off.

The voltage at the output of the error amplifier is an amplified version of the difference between the 104mV reference voltage and the feedback voltage. In this way the peak current level keeps the output in regulation.

If the feedback voltage starts to drop, the output of the error amplifier increases. This results in more current flowing through the power FET, thus increasing the power delivered to the output.

**Figure 1—Functional Block Diagram**

**APPLICATION INFORMATION**

**Figure 2—Circuit for Driving 3 WLEDs**

A typical application circuit can be seen in Figure 2. The 3 white LEDs can be driven from a voltage supply range of 2.5V to 6V at an output current of 20mA. A 0.22µF output capacitor is sufficient for most applications but an output capacitor up to 1µF may be used. A 22µH inductor with low DCR (Inductor resistance) is recommended to improve efficiency. A 1µF ceramic capacitor is recommended for the input capacitance in the real system. Schottky diodes have fast recovery and a low forward voltage and are recommended. Schottky diodes rated with 100mA to 200mA are sufficient for the MP1518. The switching characteristics during normal operation can be seen in Figure 3. The MP1518 has internal soft-start to limit the amount of current through VIN at startup and to also limit the amount of overshoot on the output. The current limit is increased by a fourth every 40µs giving a total soft-start time of 120µs.

**Steady State Operation**

$V_{IN} = 3.6V$ , 3 LEDs, 20mA

**Figure 3—Steady State Operation**

Figure 4 shows the startup behavior of the MP1518. The ramped voltage that is added to the current sense amplifier reduces the current output as the duty cycle increases. As more LEDs are added, the output voltage rises but the current that can be delivered to the load is reduced as well.

**Figure 4—Startup Waveforms**

Figure 5 shows the dependence on current limit versus duty cycle.

**Figure 5—Current Limit vs. Duty Cycle**

**Setting the LED Current**

The LED current is controlled by the feedback resistor, R1, in Figure 6. The current through the LEDs is given by the equation  $104mV/R1$ . Table 2 shows the selection of resistors for a given LED current.

**Table 2— $I_{LED}$  vs. R1**

$I_{LED}$ (mA)	R1 ( $\Omega$ )
1	104
5	20.8
10	10.4
15	6.93
20	5.2

**Analog and Digital Dimming**

There are three different ways to control dimming for the MP1518 during normal operation. The first way uses a DC voltage to control the feedback voltage. This can be seen in Figure 6. As the DC voltage increases, current starts flowing down R1, R2 and R3. The loop will continue to regulate the feedback voltage to 104mV. Thus the current has to decrease through the LEDs by the same amount of current as is being injected from the DC voltage source. With a  $V_{DC}$  from 0V to 2V, the resistor values shown for R2 and R3 can control the LED current from 0mA to 20mA.

**Figure 6—Dimming Control Using a DC Voltage**

Other applications need to use a logic signal to do the dimming. This can be seen in Figure 7. The PWM signal is applied to the EN pin of the MP1518. The LEDs will switch between full load to completely shut off. The average current through the LEDs will increase proportionally to the duty cycle of the PWM signal. The PWM signal used in Figure 7 should be 1KHz or below due to the soft-start function.

**Figure 7—PWM Dimming Control Using a Logic Signal**

If the PWM signal is above 1kHz, dimming can be achieved by using the circuit shown in Figure 8.

**Figure 8— Dimming Control Using a Filtered PWM Signal**

**Open Load Protection**

Open Load protection will shut off the MP1518 if the output voltage goes too high when the OV pin is tied to the output. In some cases an LED may fail, this will result in the feedback voltage always being zero.

The part will run at maximum duty cycle boosting the output voltage higher and higher. By tying the OV pin to the top of the LED string the MP1518 checks this condition and if the output ever exceeds 28V the MP1518 will shut down. The part will not switch again until the power is recycled. Figure 9 shows the behavior of the MP1518 into an open load.

**Figure 9—Startup Waveforms into an Open Load**

**Layout Considerations**

Careful attention must be paid to the PCB board layout and component placement. Proper layout of the high frequency switching path is critical to prevent noise and electromagnetic interference problems. Due to the high frequency switching the length and area of all the traces connected to the switch node should be minimized. Refer to the evaluation board EV0056 for a sample layout of the MP1518.
