

DESCRIPTION

The MP2000 is a low-voltage, low-dropout bipolar linear regulator. It operates from 1.35V to 6.0V input voltage, and regulates the output voltage from as low as 0.5V.

The MP2000 can supply up to 150mA of load current. The MP2000 features thermal overload and current limit protection. It is available in a 5-pin TSOT23-5 package.

Part Number	Output Voltage
MP2000DJ-ADJ	Adjustable

EVALUATION BOARD REFERENCE

Board Number	Output*	Dimensions
EV2000DJ-00A	1.2V	2.0"X x 2.0"Y x 0.4"Z

* Default output voltage adjustable from 0.5V to 5.0V using an external resistor divider.

FEATURES

- Operates with $V_{IN} = 1.35V$
- Low 300mV Dropout at 150mA Output
- $\pm 3\%$ Accurate Output Voltage
- Fixed and Adjustable Output Voltage Option
- Better Than 0.001%/mA Load Regulation
- Stable With Low-ESR Output Capacitor
- Low 65 μA Ground Current
- Internal Thermal Protection
- Current Limit Protection
- 7 μA Typical Quiescent Current at Shutdown

APPLICATIONS

- Low Current Regulators
- Battery Powered Systems
- Cellular Phones

Notes:

- Exceeding these ratings may damage the device.
- The maximum allowable power dissipation is a function of the maximum junction temperature T_J(MAX), the junction-to-ambient thermal resistance θ_{JA} , and the ambient temperature T_A. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P_D(MAX)=(T_J(MAX)-T_A)/ θ_{JA} . Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- The device is not guaranteed to function outside of its operating conditions.
- Measured on JESD51-7 4-layer PCB.

ELECTRICAL CHARACTERISTICS

Notes:

5) Dropout Voltage is defined as the input to output differential when the output voltage drops 1% below its normal value.

6) $V_{IN} = 1.35V$ for $V_{OUT} = 0.5V$ to $0.85V$

PIN FUNCTIONS

Pin #	Name	Description
1	IN	Power Source Input. IN supplies the internal power to the MP2000 and is the source of the pass transistor. Bypass IN to GND with a 2.2 μ F or greater capacitor.
2	GND	Ground.
3	$\overline{\text{EN}}$	Enable Input. Drive $\overline{\text{EN}}$ high to turn off the MP2000; low to turn it on. For automatic startup, connect $\overline{\text{EN}}$ to GND.
4	FB	Feedback Input. Connect a resistive voltage divider from OUT to FB to set the output voltage. OUT feedback threshold is 0.5V.
5	OUT	Regulator Output. OUT is the output of the linear regulator. Bypass OUT to GND with a 2.2 μ F or greater capacitor.

OPERATION

The MP2000 is a low-current, low-voltage, low-dropout linear regulator. It is intended for use in devices that require very low voltage and low quiescent current power such as wireless modems, pagers and cellular phones.

The MP2000 uses a PNP pass element and features internal thermal shutdown and an internal current limit circuit.

APPLICATION INFORMATION

Setting the Output Voltage

The output voltage can be adjusted by changing the values of the external resistor divider.

Use the following equation to determine these values:

$$V_{OUT} = 0.5V \times \left(1 + \frac{R1}{R2}\right)$$

Typically R1 + R2 are recommended to be less than 100kΩ.

In Figure 2, C2 is added for improved transient response.

PCB Layout Guide

PCB layout is very important to achieve good regulation, ripple rejection, transient response and thermal performance. It is highly recommended to duplicate EVB layout for optimum performance.

If change is necessary, please follow these guidelines and take Figure 2 for reference.

- 1) Input and output bypass ceramic capacitors are suggested to be put close to the IN Pin and OUT Pin respectively.
- 2) Ensure all feedback connections are short and direct. Place the feedback resistors and compensation components as close to the chip as possible.
- 3) Connect IN, OUT and especially GND respectively to a large copper area to cool the chip to improve thermal performance and long-term reliability.
