DESCRIPTION

The MP2603 is a low cost single cell Li-ion battery charger IC suitable for low charge current applications. It features constant current (CC) and constant voltage (CV) charging modes with programmable charge current (50mA–150mA), trickle charge and charge status indication.

The MP2603 is enabled with an input supply voltage greater than 3.5V. The charger IC is disabled when unplugged from the AC adaptor. To minimize the charger’s total solution cost, the MP2603 does not need an external reverse blocking diode, a precision current-sense resistor or a compensation capacitor at the output. MP2603 is available in a 5-pin TSOT23 package.

FEATURES

- $V_{IN}$ Surge Up to 25V
- 0.75% $V_{BATT}$ Accuracy
- Low Battery Reverse Current, (< 1uA)
- Programmable Charge Current
- Over Temperature Protection
- Over Current Protection
- Charge Status Indication
- Over Charge Protection
- No External Sense Resistor Required
- No External Reverse Blocking Diode Required
- No Output Capacitor Required for Stability

APPLICATIONS

- Bluetooth Headset
- MP3 Players
- Mini PDAs
- Cell Phones
- Digital Cameras

All MPS parts are lead-free and adhere to the RoHS directive. For MPS green status, please visit MPS website under Products, Quality Assurance page.

* For Tape & Reel, add suffix –Z (e.g. MP2603EJ–Z).
For RoHS compliant packaging, add suffix –LF (e.g. MP2603EJ–LF–Z)

PACKAGE REFERENCE

ABSOLUTE MAXIMUM RATINGS (1)
IN to GND .....................................-0.3V to +25V
All Other Pins..................-0.3V to +6.5 V
Continuous Power Dissipation (T_A = +25°C) (2) ........................................................... 0.57W
Junction Temperature...............................140°C
Lead Temperature .............................260°C
Storage Temperature.............. -65°C to +150°C

Recommended Operating Conditions (3)
Supply Voltage V_IN.........................4.75V to 5.25V
Operating Temperature.......... -20°C to +85°C

Thermal Resistance (4) θ_JA θ_JC
TSOT23 ...........................................220 .... 110.. °C/W

Notes:
1) Exceeding these ratings may damage the device.
2) The maximum allowable power dissipation is a function of the maximum junction temperature T_J (MAX), the junction-to-ambient thermal resistance θ_JA, and the ambient temperature T_A. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P_D (MAX) = (T_J (MAX)-T_A)/θ_JA. Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
3) The device is not guaranteed to function outside of its operating conditions.
4) Measured on JESD51-7, 4-layer PCB.
## ELECTRICAL CHARACTERISTICS

\( V_{\text{IN}} = 5\text{V}, \; T_{\text{A}} = +25\text{°C}, \) unless otherwise noted.

OPERATION

The MP2603 is enabled with a minimum input supply voltage of 3.5V. This power supply must also be higher than both the UVLO threshold and the battery voltage. There is an internal 500kΩ pull-down resistor connecting the IN and GND pins. The MP2603 provides CC/CV charge algorithms to automatically change modes depending on the battery status. Figure 2 shows the typical charging procedure for the MP2603.

![Figure 2—MP2603 Typical Charging Procedure](image)

The charge current, $I_{\text{CHG}}$, is programmed by connecting a resistor ($R_{\text{PGM}}$) from the IPGM pin to ground. The relationship of the charge current and the programming resistance is established by the following equation and graph. The Table1 lists the typical application setting of $I_{\text{CHG}}$.

$$I_{\text{CHG}} = 150\text{mA} \times \frac{2.53k\Omega}{R_{\text{PGM}}}$$  \hspace{1cm} (1)

</tbody>
</table>

When battery voltage falls below the trickle threshold (2.6V), charge current is limited to 10% of the programmed value to trickle charge the fully depleted battery. After the battery voltage reaches 2.6V, the charger begins to charge at the constant current of the programmed value ($I_{\text{CHG}}$). This is referred to as Constant Current (CC) mode. Once the battery voltage reaches 4.2V, the charger will operate in the Constant Voltage (CV) mode until the battery is fully charged.

**Charge Status (CHGZ)**

The open-drain CHGZ pin monitors charge status by connecting to $V_{\text{BATT}}$ through an LED and/or a resistor. The end-of-charge, or battery full, is indicated by the CHGZ pin changing from LOW to HIGH (i.e. LED turns off) when $I_{\text{CHG}}$ decreases to 10% of the programmed value.

**Thermal Protection**

To prevent overheating, the MP2603 automatically limits the die temperature to 130°C by reducing the internal current-setting reference voltage. In the thermal protection mode, the charge current reduces automatically, but remains continuous.
APPLICATION

Flow Chart of Operation

Power-On Reset (POR) feature can be applied to the MP2603 to ensure that the device starts operating in a known state when power is applied. The flow chart in Figure 4 describes the conditions and operation modes of the MP2603. CVC and CCC stand for “constant voltage charge” and “constant current charge”, respectively.
