DESCRIPTION

The MP26058 is a linear, high performance single cell Li-Ion or Li-Polymer battery charger. By integrating high voltage input protection into the charger IC, the MP26058 can tolerate an input surge up to 28V. The LDO mode makes the MP26058 suitable for power up the system when battery is not present.

The device features constant current (CC) and constant voltage (CV) charging modes with programmable charge currents (200mA to 1A), current blocking. The other features include the programmable battery full indication threshold and the LDO mode operation which keeps charging the battery after battery-full is asserted and stay in full-state as long as the valid input is maintained. MP26058 can provide load to the system if no battery is connected.

For guaranteed safe operation, the MP26058 limits the die temperature to a preset value when the device is heated up due to limited PCB space. Other safety features are battery temperature monitoring, and programmable timer to prevent prolonged charging a dead battery.

MP26058 is available in 10-pin 3mm x 3mm DFN packages.

FEATURES

- Complete Solution for Charging Single-Cell Lion-Ion Battery
- Input Surge Up to 28V
- Wide input operating range 2.8V – 7V
- Adapter or USB Input
- Programmable Charge Current: 200mA to 1A
- Programmable timer
- 7V Input Over Voltage Protection
- 0.75% V_BATT Accuracy over Temperature
- <1µA Battery Reverse Current
- 125µA Standby Current from V_IN
- Battery Temperature Monitoring
- Automatic die temperature limiting
- Fault and Charge Status Indicators
- Soft-Start to limit inrush current
- Tiny 3mm x 3mm QFN Package

APPLICATIONS

- Cell Phones
- Digital Cameras
- Smart Phones
- PDAs
- MP3 Players

*MPS* and “The Future of Analog IC Technology” are Registered Trademarks of Monolithic Power Systems, Inc.
MP26058-28V, 1A Li+ Linear Battery Charger with Timer and LDO Mode

Absolute Maximum Ratings (1)

IN to GND: –0.3V to +28V
All Other Pins to GND: –0.3V to +6.5V
ACOK & CHG: Maximum Sink Current: 20mA
Junction Temperature: –140°C
Lead Temperature: 260°C
Storage Temperature: –65°C to +150°C

Recommended Operating Conditions (2)

Nominal Supply Voltage $V_{IN}$: 3.5V to 5.5V
Operating Temperature: –40°C to +85°C

Thermal Resistance (3)

$\theta_{JA}$: 3x3 QFN10: 50°C/W
$\theta_{JC}$: 12°C/W

Notes:
1) Exceeding these ratings may damage the device.
2) The device is not guaranteed to function outside of its operating conditions.
3) Measured on JEDEC51-7 4 layer board.

Electrical Characteristics

$V_{IN} = 5V$, $V_{SHDN} = 0V$, $T_A = +25^\circ C$, unless otherwise noted.

### BLOCK DIAGRAM

![Block Diagram](image)

**Figure 1—Functional Block Diagram**

### OPERATION

#### Input Voltage Range

The MP26058 has built-in input voltage surge protection as high as +28V. The charger IC will be automatically disabled when the input voltage is lower than 2.2V or higher than 7.0V. For MP26058, the open-drain pin `ACOK` is used to indicate an input power good condition (i.e. 2.8V < `VIN` < 7.0V). If the input voltage is lower than the battery voltage, the IC is also disabled to prevent the battery from draining.

#### Charge Cycle (Mode Change: CC -> LDO)

Figure 2 below shows the typical charging profile for the MP26058. It begins charging at the constant current of the programmed value (I_{CHG}). This is referred to as Constant Current (CC) mode. Once the battery voltage reaches 4.2V, the charger will operate in the LDO mode to keep the battery is fully charged. The charge current drops during LDO mode, and the battery full indication is set when the charge current reduced to the preset value based on R_{BF}. After 262144 cycles of continuous charging, if the battery is still not reaching IBF condition, the on-chip timer will terminate the charger to prevent charging the dead battery for excessive long time and the fault condition will be flagged by flashing the `CHG` LED.

![Charging Profile](image)

**Figure 2—MP26058 Typical Charging Profile**
Programming of Charge Current and Battery Full Current

The charge current (I_{CHG}) is set by a resistor (R_{CHG}) connecting from the ISET pin to GND. The relationship of the charge current and the programming resistance is established by the following table and graph.

<table>
<thead>
<tr>
<th>R_{CHG} (kΩ)</th>

</tbody>
</table>

Charge Current vs 1/R_{CHG} Resistance

The recommended resistance for programming the charge current is 2.3kΩ<R_{CHG}<11kΩ. The battery full charge current threshold (I_{BF}) is programmed by connecting a resistor R_{BF} from the IBF pin to GND:

\[ I_{BF} = \frac{1A \times 1.7kΩ}{R_{BF}} \]

Where 2R_{CHG}<R_{BF}<10R_{CHG}. The open-drain pin CHG is used to indicate charging status. When the battery full condition is reached or any other condition prevents the charger from charging, CHG will become a floating.

Timer Operation

The TMR pin is used to set the internal oscillator frequency: \( F_{OSC} = 11Hz \times \frac{\mu F}{C_{TMR}} \)

The on-chip timer will start count down after initial power-up or every time being enabled. This timer will limit the max charge time when battery is short to ground to 16384 internal oscillating cycles, or if the total charge time exceeds 262144 cycles and the battery full has not been qualified, then it will terminate the charger and a fault will be set by flashing CHG LED at the rate of half the internal oscillation frequency.. After fault reporting, the charger can be re-initiated only by recycling the power supply or SHDN signal. The timer function can be disabled by shorting TMR pin to ground.

Negative Thermal Coefficient (NTC) Thermistor

The MP26058 has a built-in NTC resistance window comparator. If configured as the typical application circuit as indicated in Figure 1, the MP26058 will cease charging if R_{NTC}<32.3kΩ or R_{NTC}>376.6kΩ. This represents a valid charging temperature range of 0°C to 50°C for the TH11-4H104F NTC resistor.

Thermal Protection

The MP26058 has proprietary thermal protection to prevent the IC from overheating. When in thermal protection mode, the charge current will reduce to maintain the safe junction temperature. Operating in thermal protection mode will slow down the charging process. Lowering the input voltage and enhancing thermal dissipation to the environment can effectively prevent the IC from going into thermal protection mode.
APPLICATION

Flow Chart of Operation

Power-On Reset (POR) feature can be applied to the MP26058 to ensure that the device starts operating in a known state. The flowchart in Figure 4 describes the conditions and operation modes of the MP26058. CVC and CCC stand for "constant voltage charge" and "constant current charge", respectively.
