DESCRIPTION

The MP26060 is a linear, high-performance single cell Li-Ion battery charger. By integrating high voltage input protection into the charger IC, the MP26060 can tolerate an input surge up to 24V.

The device features constant current (CC) and constant voltage (CV) charging modes with programmable charge currents (85mA to 1A), programmable battery full threshold, thermal protection, battery temperature monitoring, reverse current blocking, and trickle charge. The device also provides AC adapter power good and charge status indications to the system.

MP26060 is available in a 10-pin 3mm x 3mm QFN package.

FEATURES

- Input Surge Up to 24V
- Adapter or USB Input
- 4.15V Output for Safe Charge
- Programmable Charge Current: 85mA to 1A
- Proprietary Constant Voltage Auto Recharge
- Proprietary Over-Voltage Protection
- 0.75% \( V_{\text{BATT}} \) Accuracy
- \(<1\mu\text{A} \) Battery Reverse Current
- 90\( \mu\text{A} \) Standby Current from \( V_{\text{IN}} \)
- Over Current Protection
- AC Adapter Power Good Indicator
- Charge Status Indicator
- Programmable Soft-Start
- Programmable Charge Termination Current Threshold
- Tiny 10-Pin QFN (3mm x 3mm) Package

APPLICATIONS

- Cell Phones
- MP3 Players
- Smart Phones
- PDAs
- Digital Cameras

*MPS* and “The Future of Analog IC Technology” are Registered Trademarks of Monolithic Power Systems, Inc.

**Thermal Resistance**

QFN10 (3mm x 3mm) ........... 50 ...... 12°C/W

**Notes:**

1) Exceeding these ratings may damage the device.
2) The maximum allowable power dissipation is a function of the maximum junction temperature $T_J$ (MAX), the junction-to-ambient thermal resistance $\theta_{JA}$, and the ambient temperature $T_A$. The maximum allowable continuous power dissipation at any ambient temperature is calculated by $P_D$ (MAX) = ($T_J$ (MAX) – $T_A$)/$\theta_{JA}$. Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.

3) The device is not guaranteed to function outside of its operating conditions.

4) Measured on JESDS1-7, 4-layer PCB.

### ABSOLUTE MAXIMUM RATINGS (1)

- IN to GND ........................................... –0.3V to +24V
- All Other Pins to GND .................. –0.3V to +6.5V
- Continuous Power Dissipation ($T_A = +25°C$) (2) ........................................... 2.5W
- Junction Temperature .................. 140°C
- Lead Temperature .......................... 260°C
- Storage Temperature ................. –65°C to +150°C

**Recommended Operating Conditions** (3)

- Nominal Supply Voltage $V_{IN}$ ........... 3.5V to 6.5V
- Operating Junct. Temp ($T_J$) ..... –20°C to +125°C
# ELECTRICAL CHARACTERISTICS

$V_{IN} = 5V, V_{EN} = 0V, T_A = +25^\circ C$, unless otherwise noted.

TYPICAL PERFORMANCE CHARACTERISTICS

$V_{IN} = 5V$, $C_{IN} = 10\mu F$, $C_{OUT} = 4.7\mu F$, $T_A = +25^\circ C$, unless otherwise noted.

**Battery Charge Curve**

$R_{CHG} = 2.87k\Omega$

**Charge Current vs Battery Voltage**

$R_{CHG} = 1.69k$

$R_{CHG} = 2.87k$

$R_{CHG} = 8.66k$

**Battery Voltage vs Input Voltage**

$I_{CHG} = 0.87A$

**Charge Currents vs Battery Voltage**

**Startup with $EN$**

$R_{CHG} = 1.96k\Omega$

**Shutdown with $EN$**

$R_{CHG} = 1.96k\Omega$
TYPICAL PERFORMANCE CHARACTERISTICS (continued)

$V_{IN} = 5V$, $C_{IN} = 10\mu F$, $C_{OUT} = 4.7\mu F$, $T_A = +25^\circ C$, unless otherwise noted.

1. Charge Current vs Input Voltage
   \[R_{CHG} = 2.87k\Omega\]

2. Charge Current vs $R_{CHG}$ Resistance

3. Reverse Current vs Battery Voltage
   \[V_{IN}=0V\]

4. Charge Current vs Temperature
   \[V_{BAT} = 3.8V, R_{CHG} = 1.96k\Omega\]

5. Battery Voltage vs Temperature
OPERATION

Input Voltage Range
The MP26060 has built-in input voltage surge protection up to +24V. The charger IC will be automatically disabled when the input voltage is lower than 2.5V or higher than 6.5V. The open-drain pin ACOK is used to indicate an input power good condition (i.e. 2.5V<V IN<6.5V). If the input voltage is lower than the battery voltage, the IC is also disabled to prevent the battery from draining.

Charge Cycle (Mode Change: Trickle -> CC-> CV)
Figure 2 below shows the typical charging profile for the MP26060. Figure 3 shows the typical charging procedure. For a fully depleted battery with a terminal voltage lower than 2.6V, the MP26060 will start with the trickle charge (preconditioning) at 10% of the programmed full charge current. After the battery voltage reaches 2.6V, the charger begins charging at the constant current of the programmed value (I CHG). This is referred to as Constant Current (CC) mode. Once the battery voltage reaches 4.15V, the charger will operate in the constant voltage (CV) mode until the battery is fully charged. The charge current drops during CV mode, and the battery full indication is set when the charge current in the CV mode is reduced to the programmed full battery current (I BF).
Battery Over-Voltage Protection and Automatic Recharge
At any time when \( V_{\text{BATT}} \) is 50mV higher than the trimmed charge target, the MP26060 reduces its charge current to 0µA. This ensures the safety of the battery. Also, the CV control loop always monitors the battery voltage such that it will automatically recharge the battery when it is depleted below the target level.

Programming of Charge Current and Battery Full Current
The charge current \( I_{\text{CHG}} \) is set by a resistor \( R_{\text{CHG}} \) connecting from the ISET pin to GND. See Table 1 and Figure 4. The relationship of the charge current and the programming resistance is established by:

\[
I_{\text{CHG}} = \frac{1.4 \times 1.7k\Omega}{R_{\text{CHG}}}
\]

<table>

</tbody>
</table>

Table 1—\( R_{\text{CHG}} \) and \( I_{\text{CHG}} \) Relationship

Charge Current vs 1/R\(_{\text{CHG}}\) Resistance

The recommended resistance for programming the charge current is 2.3k\Ω<\( R_{\text{CHG}} <11k\Omega \). The battery full charge current threshold \( I_{\text{BF}} \) is programmed by connecting a resistor \( R_{\text{BF}} \) from the IBF pin to GND:

\[
I_{\text{BF}} = \frac{1.4 \times 1.7k\Omega}{R_{\text{BF}}}
\]

Where 2\( R_{\text{CHG}} < R_{\text{BF}} < 10R_{\text{CHG}} \). The open-drain pin \( \text{CHG} \) is used to indicate charging status. When the battery full condition is reached or any other condition prevents the charger from charging, \( \text{CHG} \) will become a floating pin.
Charge Status Indicator (CHG)
The MP26060 has an integrated charge status pin that remains low while the battery is charging. Once the charge current has reduced to the battery full charge current threshold ($I_{BF}$), the CHG pin will become high impedance.

The ACOK and CHG can be used to drive LEDs (Figure 1) or to interface with the system.

When interfacing with the system, glitches may occur on the power supply input (IN) when the AC-power adapter is plugged in and out. It is desirable to blank the glitches so that the system can properly operate with AC power adaptor. A simple solution is to add the RC filter (C5 and C6) on the pin ACOK / CHG as shown in Figure 5. The size of C5 and C6 depends on the width of the glitch and the rise time of the interface.

Thermal Protection
The MP26060 has proprietary thermal protection to prevent the IC from overheating. When in thermal protection mode, the charge current becomes a saw-tooth waveform instead of a DC current. The average current of the saw-tooth waveform will be lower than the programmed DC charge current to prevent the IC from overheating. The frequency and amplitude of the saw-tooth current waveform can be altered by changing the capacitance value connected to the SS pin. Operating in thermal protection mode will slow down the charging process. Lowering the input voltage and enhancing thermal dissipation to the environment can effectively prevent the IC from going into thermal protection mode.

APPLICATION

Flow Chart of Operation

Power-On Reset (POR) feature can be applied to the MP26060 to ensure that the device starts operating in a known state. The flow chart in Figure 5 describes the conditions and operation modes of the MP26060. CVC and CCC stand for “constant voltage charge” and “constant current charge”, respectively.

Figure 6—Flow Chart of Operation
