DESCRIPTION
The MP2608 is a dual-input, linear, high-performance low-cost single cell Li-Ion or Li-Polymer battery charger. It accepts two power inputs, one from a USB (Universal BUS) port and the other from an AC adapter. By integrating high voltage input protection into the charger IC, the MP2608 can tolerate an input surge up to 28V. Due to the protection inputs function, low-cost, large output tolerance adapters can be used safely.

The device features constant current (CC) and constant voltage (CV) charging modes with programmable charge currents (100mA to 1.0A), current blocking and trickle charge. The charge current for adapter input can be programmed by an external resistor, while the charge current for USB input is pre-set at 450mA. The device also provides charge status and fault indications to the system.

For guaranteed safe operation, the MP2608 folds back charge current when the device is heated up due to limited PCB space. Other safety features are including battery temperature monitoring, and programmable timer to complete the charging cycle.

MP2608 is available in a 10-pin 3mm x 3mm QFN package.

FEATURES
- Complete Solution for Charging Single-Cell Lion-Ion Battery
- Input Surge Up to 28V
- Adapter and USB Input
- Programmable Charge Current: 100mA to 1.0A
- Pre-set USB Charge Current: 450mA
- Proprietary Constant Voltage Auto Recharge
- Proprietary Over-Voltage Protection
- 0.75% V_BATT Accuracy over Temperature
- <1µA Battery Reverse Current
- 125µA Standby Current from V_IN
- Battery Temperature Monitoring
- Thermal Protection
- Fault and Charge Status Indicators
- Internal Soft-Start
- Tiny 3mm x 3mm QFN Package

APPLICATIONS
- Cell Phones
- Digital Cameras
- Smart Phones
- PDAs
- MP3 Players

Figure 1—Functional Block Diagram
OPERATION

Input Auto Selection and Voltage Range
The MP2608 is a dual-input charger, when both input sources are present, MP2608 selects only one power source to charge the battery. When the adapter input voltage is higher than the UVLO threshold, IN is selected as the power source. Otherwise the USB input is selected. If both the inputs are above UVLO but the adapter input voltage is below the battery voltage, while the USB voltage is higher than the battery voltage, then the USB input is used to charge the battery.

In case there is no power source available or both the two input are below the UVLO, the MP2608 is in the sleep mode, in which the current into the BATT pin is reduced to TBD µA. The IC is also disabled to prevent the battery from draining.

The MP2608 has built-in input voltage surge protection as high as +28V. The charger IC will be automatically disabled when the input voltage is lower than 2.5V or higher than 6.0V.

Charge Cycle (Mode Change: Trickle -> CC-> CV)
Figure 2 below shows the typical charging profile for the MP2608. For a fully depleted battery with a terminal voltage lower than 2.6V, the MP2608 will start with the trickle charge (preconditioning) at 10% of the programmed full charge current. After the battery voltage reaches 2.6V, the charger begins charging at the constant current of the programmed value (I_{CHG}) and the charge timer starts counting down. This is referred to as Constant Current (CC) mode. Once the battery voltage reaches 4.2V, the charger will operate in the constant voltage (CV) mode until the battery is fully charged. The charge current drops during CV mode, and the battery full indication is set when the charge timer is time off. The charge timer is to protect the system from charging a dead battery for excessive long time.

**Figure 2—MP2608 Typical Charging Profile**

Charge Termination and Auto-Recharge
At any time when V_{BATT} is 50mV higher than the trimmed charge target, the MP2608 reduces its charge current to 0µA. This ensures the safety of the battery. Also, the CV control loop always monitors the battery voltage such that it will automatically recharge the battery when it is depleted below the target level.

Upon V_{BATT} drops to 4.0V, the charger will automatically restart the charge cycle until the end of the timeout. When the input adapter is unplugged, there is only 1µA leakage current from battery drawn by the MP2608.

Programming of Charge Current and Battery Full Current
The Charge Current (I_{CHG}) of Adaptor input can be programmed from 0.1A to 1A by a resistor (R_{CHG}) connecting from the ICHG pin to GND. The relationship of the charge current and the programming resistance is established by the following table and graph.

The recommended resistance for programming the charge current is TBD. The battery full charge current threshold (I_{BF}) is programmed by connecting a resistor R_{BF} from the I_{BF} pin to GND:

\[ I_{BF} = 1A \times 1.7k\Omega/R_{BF} \]

When the USB is selected as the power source, the charge current is fixed at a pre-set value 450mA, which is a typical value of USB current.

<td>TBD</td>
</tr>
</tbody>
</table>

Charge Status and Fault Indication

The open drain pin $STATUS$ is used to indicate charging status. While battery is being charged, the $STATUS$ pin is pulled low, when the battery full condition is reached or any other condition prevents the charger from charging, the $STATUS$ pin will become a floating. $STATUS$ is then latched till a new charge cycle is started.

Upon a time-out fault event happen, the $FAULT$ pin is pulled low. When the $V_{BATT}$ is lower than 2.6V for 1/8th of timeout period or the charging can not reach EOC status before the timeout happens, this fault status is latched, the charging is suspended, and the $FAULT$ pin is pulled low. To clear this fault, either the $V_{IN}$ or $V_{USB}$ should be recycled. One time-out period is equivalent to $2^{15}$ oscillator clock cycles. With a 1µF capacitor on the TMR pin, it takes 3.64 hours.

The Power On and recharge cycle are illustrated in Figure 4.
