DESCRIPTION

The MP2618 is a monolithic switching charger for 2-3 cell Li-Ion battery packs with a built-in internal power MOSFET. It achieves up to 2A charge current with current mode control for fast loop response and easy compensation. The charge current can be programmed by sensing the current through an accurate sense resistor.

MP2618 regulates the charge voltage and charge current using two control loops to realize high accuracy CC charge and CV charge.

The system power path management function ensures continuous supply to the system by automatically selecting the input or the battery. Power path management separates charging current from system load. When the MP2618 realizes current sharing of the input current, charge current will drop down according to the increase of the system current.

Fault condition protection includes cycle-by-cycle current limiting, and thermal shutdown. Other safety features include battery temperature monitoring, charge status indication and programmable timer to cease the charging cycle.

The MP2618 is available in a 28-pin, 4mmx5mm QFN package.

FEATURES

- Charges 2-3 cell Li-Ion battery packs
- Wide Operating Input Range
- Up to 2A Programmable Charging Current
- Power Path Management with Current Sharing
- ±0.75% $V_{BATT}$ Accuracy
- 0.28Ω Internal Power MOSFET Switch
- Up to 90% Efficiency
- Fixed 600kHz Frequency
- Preconditioning for fully depleted batteries
- Charging Operation Indicator
- Input Supply and battery fault indicator
- Thermal Shutdown
- Cycle-by-Cycle Over Current Protection
- Battery Temperature Monitor and Protection

APPLICATIONS

- Netbook PC
- Distributed Power Systems
- Chargers for 2-Cell or 3-Cell Li-Ion Batteries
- Pre-Regulator for Linear Regulators

*MPS* and “The Future of Analog IC Technology” are Registered Trademarks of Monolithic Power Systems, Inc.

Max Differential Input Voltage (RG1 to RG2) .............................................. 5V

**Recommended Operating Conditions** (3)

Supply Voltage $V_{IN}$ .............................................. 5.5V to 24V
VCC, RG1, RG2 to GND .............................................. 2.5V to 40V
Operating Junct. Temp. ($T_J$) .............................................. $-20^\circ$C to $+125^\circ$C

**Thermal Resistance** (4) \(\theta_{JA}\) \(\theta_{JC}\)

4mmx5mm QFN28 .............................................. 40 \(\circ\) 9 \(\circ\) C/W

**Notes:**
1) Exceeding these ratings may damage the device.
2) The maximum allowable power dissipation is a function of the maximum junction temperature $T_J$ (MAX), the junction-to-ambient thermal resistance $\theta_{JA}$, and the ambient temperature $T_A$. The maximum allowable continuous power dissipation at any ambient temperature is calculated by $P_D$ (MAX) = ($T_J$ (MAX) - $T_A$)/$\theta_{JA}$. Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
3) The device is not guaranteed to function outside of its operating conditions.
4) Measured on JESD51-7, 4-layer PCB
**ELECTRICAL CHARACTERISTICS**

$V_{IN} = 19V$, $T_A = +25^\circ C$, $CELLS=0V$, unless otherwise noted.

OPERATION

The MP2618 is a peak current mode controlled switching charger for use with Li-Ion batteries.

Figure 2 shows the block diagram. At the beginning of a cycle, M1 is off. The COMP voltage is higher than the current sense result from amplifier A1’s output and the PWM comparator’s output is low. The rising edge of the 600 kHz CLK signal sets the RS Flip-Flop. Its output turns on M1 thus connecting the SW pin and inductor to the input supply.

The increasing inductor current is sensed and amplified by the Current Sense Amplifier A1. Ramp compensation is summed to the output of A1 and compared to COMP by the PWM comparator.

When the sum of A1’s output and the Slope Compensation signal exceeds the COMP voltage, the RS Flip-Flop is reset and M1 turns off. The external switching diode D1 then conducts the inductor current.

If the sum of A1’s output and the Slope Compensation signal does not exceed the COMP voltage, then the falling edge of the CLK resets the Flip-Flop.

The MP2618 have two internal linear regulators power internal circuit, VREF33 and VREF25. The output of 3.3V reference voltage can also power external circuitry as long as the maximum current (50mA) is not exceeded. A 1µF bypass capacitor is required from VREF33 to GND to ensure stability.

Charge Cycle (Mode change: Trickle→ CC→ CV)

The battery current is sensed via RS1 (Figure 2) and amplified by A2. The charge will start in “trickle charging mode” (10% of the RS programmed current I_CC) until the battery voltage reaches 3V/cell. If the charge stays in the “trickle charging mode” till “timer out” condition triggered, and the charge is terminated. Otherwise, the output of A2 is then regulated to the level set by RS1. The charger is operating at “constant current charging mode.” The duty cycle of the switcher is determined by the COMPI voltage that is regulated by the amplifier GMI.

When the battery voltage reaches the “constant voltage mode” threshold, the amplifier GMV will regulate the COMP pin, and then the duty cycle. The charger will then operate in “constant voltage mode.”

Automatic Recharge

Once the battery charging current drops below the termination threshold, the charger will cease charging and the CHGOK pin becomes an open drain. If for some reason, the battery voltage is lowered to 4.0V/Cell, recharge will automatically kick in.

Charger Status Indication

MP2618 has two open-drain status outputs: CHGOK and ACOK. The ACOK pin pulls low when an input voltage is greater than battery voltage 300mV and over the under voltage lockout threshold. CHGOK is used to indicate the status of the charge cycle. Table 1 describes the status of the charge cycle based on the CHGOK and ACOK outputs.

<table>

</tr>
<tr>
<td>high</td>
<td>high</td>
<td>(V_{IN} - V_{BAT} &lt; 0.3V). (V_{IN} &lt; UVLO)</td>
</tr>
</tbody>
</table>

Timer Operation

MP2618 uses internal timer to terminate the charge if the timer times out. The timer duration is programmed by an external capacitor at the TMR pin.

The trickle mode charge time is:

\[ T_{TICKLE\_TMR} = 30\text{mins} \times \frac{C_{TMR}}{0.1\mu\text{F}} \]

The total charge time is:

\[ T_{TOTAL\_TMR} = 3\text{hours} \times \frac{C_{TMR}}{0.1\mu\text{F}} \]
Negative Thermal Coefficient (NTC) Thermistor

The MP2618 has a built-in NTC resistance window comparator, which allows MP2618 to sense the battery temperature via the thermistor packed internally in the battery pack to ensure a safe operating environment of the battery. A resistor with appropriate value should be connected from VREF33 to NTC pin and the thermistor is connected from NTC pin to GND. The voltage on NTC pin is determined by the resistor divider whose divide ratio depends on the battery temperature. When the voltage of pin NTC falls out of NTC window range, MP2618 will stop the charging. The charger will restart if the temperature goes back into NTC window range.

Power Path Management

MP2618 can implement a switching charger circuit with power path management function, which realizes the current sharing of the charger and system load. In other words, MP2618 senses the system current and feeds it back, then reduces charge current according to the increase of the system current.

However, after the charge current decrease to 0, the system current can only be limited by the adapter.

The system current is satisfied first and always. It chooses the adapter as its power source when the adapter plugs in, and the battery is the backup power source when the adapter is removed.

Figure 3 to Figure 6 shows the charge profile, operation waveform and flow chart, respectively.

OPERATION FLOW CHART

Figure 5—Normal Charging Operation Flow Chart
OPERATION FLOW CHART (continued)

Normal Operation

- **Charge Mode?**
  - $V_{\text{BATT}}>V_{\text{BATT, FULL}}$
  - $V_{\text{BATT, TC}}<V_{\text{BATT}}<V_{\text{BATT, FULL}}$
  - $V_{\text{BATT}}<V_{\text{BATT, TC}}$

- **C.V.C**
  - $I_{\text{ICHG}}<I_{\text{B}}$
  - Battery Full?
    - Yes
    - **Charger “On”, CHGOK is low**
    - **Charge Mode?**
      - No
      - $V_{\text{BATT}}<V_{\text{BATT, RECHG}}$
    - No
    - **Charger “Off”, CHGOK is high**
  - No

- **C.C.C**
  - $V_{\text{BATT}}>V_{\text{BATT, FULL}}$
  - No

- **T.C.C**
  - $V_{\text{BATT}}>V_{\text{BATT, TC}}$
  - No

Power Path Management

- **SYS Output Current Increase**
  - $I_{\text{SYS}}+I_{\text{ICHG}}>I_{\text{lim}}$?
    - Yes
    - **Charge Current Decrease**
  - No

- **ISYS out of control**
  - No charge current

Fault Protection

- **Timer Out ?**
  - Yes
  - **NTC Fault?**
    - Yes
    - **Charge Termination, CHGOK is high**
  - No

- **NTC OK?**
  - Yes
  - **Charge Current Thermal Shutdown, CHGOK is high**

- **Tj<=130°C?”**
  - Yes
  - **Charger Recovery, Return to Normal Operation**
APPLICATION INFORMATION

Setting the Charge Current

1. Standalone Switching Charger

The charge current of MP2618 is set by the sense resistor RS1. The charge current programmable formula is as following:

$$I_{C H G}(A) = \frac{200mV}{RS1(m\Omega)}$$ (1)

2. Switching Charger with Power Path Management

Figure 7 shows the charge current sharing with the system current.

$$Gain = \frac{RGS1}{RG1}$$ (2)

The voltage of OUT1 pin, $V_{OUT1}$ can be calculated from:

$$V_{OUT1} = I_{SYS} \times RS2 \times Gain = \frac{I_{SYS} \times RS2 \times RGS1}{RG1}$$ (3)

When the system current increased $\Delta I_{SYS}$, to satisfy the charge current decreased $\Delta I_{SYS}$ accordingly, the relationship should be:

$$\Delta I_{BAT} = \frac{\Delta V_{OUT1}}{RS1} = \frac{\Delta I_{SYS} \times RS2 \times RGS1}{RS1 \times RG1}$$ (4)

Because $\Delta I_{SYS} = \Delta I_{BAT}$, we can get:

$$\frac{RS1}{RS2} = \frac{RGS1}{RG1}$$ (5)

RGS1/2 causes the charge current sense error as it changes the sense gain of A2, which can be calculated from:

$$G_{A2} = \frac{12.3(k\Omega)}{2(k\Omega) + RGS(k\Omega)}$$ (6)

The charge current is set as:

$$I_{C H G}(A) = \frac{1230}{G_{A2} \times RS1(m\Omega)}$$ (7)

Then the influence of $R_{GS1}$ to the charge current is:

$$I_{C H G}(A) = \frac{2000 + RGS(\Omega)}{10 \times RS1(m\Omega)}$$ (8)

To decrease the power loss of the sensing circuit, choose RS2 as small as possible, 20m is recommended. Too small $R_{G1}$ results in too big current sense error of the system current, 50Ω is at least.

Substitute these two values into equation (5), then the calibrated charge current set formula in power path application is got from equation (8):

$$I_{C H G}(A) = \frac{2000 + 2.5 \times RS1(m\Omega)}{10 \times RS1(m\Omega)}$$ (9)

Following table is the calculated RS1 and RGS1 value for setting different charge current.

<table>
<thead>
<tr>
<th>$I_{C H G}(A)$</th>
<th>RGS(Ω)</th>
<th>RS1(mΩ)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>280</td>
<td>110</td>
</tr>
<tr>
<td>1.5</td>
<td>402</td>
<td>160</td>
</tr>
<tr>
<td>1</td>
<td>665</td>
<td>260</td>
</tr>
<tr>
<td>0.8</td>
<td>909</td>
<td>360</td>
</tr>
<tr>
<td>0.5</td>
<td>2k</td>
<td>800</td>
</tr>
</tbody>
</table>

If choose different RS2 and RG1, re-calculated from equation (5) and equation (8), then get the different equation (9) and the table.

Also, any relationship between $\Delta I_{SYS}$ and $\Delta I_{BAT}$ can be realized by re-calculate equation (4), (5) and (8).
Selecting the Inductor
A 1µH to 10µH inductor is recommended for most applications. The inductance value can be derived from the following equation.

\[ L = \frac{V_{OUT} \times (V_{IN} - V_{OUT})}{V_{IN} \times \Delta I_L \times f_{OSC}} \]  

(10)

Where \( \Delta I_L \) is the inductor ripple current. \( V_{OUT} \) is the 2/3 cell battery voltage.

Choose inductor current to be approximately 30% if the maximum charge current, 2A. The maximum inductor peak current is:

\[ I_{L\text{(MAX)}} = I_{CHG} + \frac{\Delta I_L}{2} \] 

(11)

Under light load conditions below 100mA, larger inductance is recommended for improved efficiency.

For optimized efficiency, the inductor DC resistance is recommended to be less than 200mΩ.

NTC Function
As Figure 8 shows, the low temperature threshold and high temperature threshold are preset internally via a resistive divider, which are 73%-VREF33 and 30%-VREF33. For a given NTC thermistor, we can select appropriate R3 and R6 to set the NTC window.

In detail, for the thermistor (NCP18XH103) noted in above electrical characteristic,

At 0°C, \( R_{NTC\text{-Cold}} = 27.445k \);
At 50°C, \( R_{NTC\text{-Hot}} = 4.1601k \).

Assume that the NTC window is between 0°C and 50°C, the following equations could be derived:

\[ \frac{R6/R_{NTC\text{-Cold}}}{R3 + R6/R_{NTC\text{-Cold}}} = \frac{V_{TH\text{-Low}}}{V_{TH\text{-Low}}} = 73\% \] 

(12)

\[ \frac{R6/R_{NTC\text{-Hot}}}{R3 + R6/R_{NTC\text{-Hot}}} = \frac{V_{TH\text{-High}}}{V_{TH\text{-High}}} = 30\% \] 

(13)

According to equation (12) and equation (13), we can find that R3 = 9.63k and R6 = 505k.

To be simple in project, making R3=10k and R6 no connect will approximately meet the specification.

Selecting the Input Capacitor
The input capacitor reduces the surge current drawn from the input and also the switching noise from the device. The input capacitor impedance at the switching frequency should be less than the input source impedance to prevent high frequency switching current passing to the input. Ceramic capacitors with X5R or X7R dielectrics are highly recommended because of their low ESR and small temperature coefficients. For most applications, a 4.7µF capacitor is sufficient.

Selecting the Output Capacitor
The output capacitor keeps output voltage ripple small and ensures regulation loop stability. The output capacitor impedance should be low at the switching frequency. Ceramic capacitors with X5R or X7R dielectrics are recommended.

PC Board Layout
The high frequency and high current paths (GND, IN and SW) should be placed to the device with short, direct and wide traces. The input capacitor needs to be as close as possible to the IN and GND pins. The external feedback resistors should be placed next to the FB pin. Keep the switching node SW short and away from the feedback network.
PACKAGE INFORMATION

QFN28 (4mm x 5mm)

NOTE:
1) ALL DIMENSIONS ARE IN MILLIMETERS.
2) EXPOSED PADDLE SIZE DOES NOT INCLUDE MOLD FLASH.
3) LEAD COPLANARITY SHALL BE 0.10 MILLIMETER MAX.
4) DRAWING CONFORMS TO JEDEC MO-220, VARIATION VHGD-3.
5) DRAWING IS NOT TO SCALE.
