

DESCRIPTION

The MP62040/MP62041 Power Distribution Switch is designed for high-side load switch. The switch operates from 1.7V to 5.5V nominal input voltage and includes an 85mΩ power MOSFET to handle up to 2A continuous load.

The MP62040/MP62041 has slew rate control with 115μs rising time to limit inrush current when enabling the switch.

The built-in level shift function allows a logic signal on enable input that may be different from the supply voltage to switch the high side P-channel MOSFET ON or OFF.

The MP62040/MP62041 is available in an ultra-small UTQFN4 package, with ultra-low height (0.55mm typ).

FEATURES

- 2A Continuous Current
- 1.7V to 5.5V Supply Range
- Soft Start: 115μs
- 1μA Shutdown Current
- 85mΩ MOSFET
- Active High & Active Low Options
- Space saving 1.6x1.2 mm UTQFN4 Package (0.55mm Height)

APPLICATIONS

- Load switch in portable applications
- Battery switch-over circuits
- Level translator

Notes:

- Exceeding these ratings may damage the device.
- The maximum allowable power dissipation is a function of the maximum junction temperature T_J(MAX), the junction-to-ambient thermal resistance θ_{JA} , and the ambient temperature T_A. The maximum allowable continuous power dissipation at any ambient temperature is calculated by PD(MAX)=(T_J(MAX)-T_A)/ θ_{JA} . Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- Pulse width <300 μ s and duty cycle < 2%
- Continuous body diode conduction (reverse conduction) is not recommended.
- Measured on JESD51-7, 4-layer PCB.

DETAILED DESCRIPTION

The MP62040/MP62041 Power Distribution Switch is designed for high-side load switch. The switch operates from 1.7V to 5.5V nominal input voltage and can handle up to 2A continuous load.

Enable

The logic pin disables the switch to reduce overall supply current. Once the EN pin reaches logic enable threshold, the MP62040/MP62041 is enabled and the supply current is very small, only 2 μ A.

APPLICATION INFORMATION

Power-Supply Considerations

Over 10 μ F capacitor between IN and GND is recommended. This precaution reduces power-supply transients that may cause ringing on the input.

In order to achieve smaller output load transient ripple, placing a high-value electrolytic capacitor on the output pin(s) is recommended when the load is heavy.
