DESCRIPTION
The MPM3805B is an automotive-grade, step-down module converter with a built-in inductor and power MOSFETs. It achieves 0.6A of peak output current from a 2.5V to 6V input voltage range, with excellent load and line regulation. The output voltage is fixed to 1.2V, so the device only requires input and output capacitors to complete the design.

The device’s integrated inductor simplifies the power system design and provides easy, efficient use. Constant-on-time (COT) control provides fast transient response and eases loop stabilization. Fault protections include cycle-by-cycle current limiting and thermal shutdown (TSD).

The MPM3805B is ideal for a wide range of automotive applications, including small ECUs, camera modules, telematics, and infotainment systems. It is available in a small, surface-mounted QFN-12 (2.5mmx3.0mmx0.9mm) package.

FEATURES
- Guaranteed Industrial/Automotive Temp
- Wide 2.5V to 6V Operating Input Range
- Fixed 1.2V Output
- Up to 0.6A Peak Output Current
- 100% Duty Cycle in Dropout Mode
- Forced Continuous Conduction Mode (CCM)
- EN and Power Good for Power Sequencing
- Cycle-by-Cycle Over-Current Protection
- Short-Circuit Protection with Hiccup Mode
- Only Requires Two External Ceramic Capacitors
- Total Solution Size of 6mmx3.8mm
- Available in a QFN-12 (2.5mmx3.0mmx0.9mm) Package
- Available in AEC-Q100 Grade 1

APPLICATIONS
- Automotive ECUs
- Rear Cameras
- E-Calls
- Telematics
- Infotainment Systems

All MPS parts are lead-free, halogen free, and adhere to the RoHS directive. For MPS green status, please visit the MPS website under Quality Assurance. “MPS”, the MPS logo and “Simple, Easy Solutions” are registered trademarks of Monolithic Power Systems, Inc. or its subsidiaries.

ABSOLUTE MAXIMUM RATINGS (1)

Supply voltage (V_IN) ............................................. 6.5V
All other pins ............................................. -0.3V to +6.5V
Junction temperature ........................................ 150°C
Lead temperature ........................................ 260°C
Continuous power dissipation (T_A = 25°C) (2) .......................................................... 1.9W
Storage temperature ................................. -65°C to +150°C

ESD Rating
Human body model (HBM) .................. 2kV
Charged device model (CDM) ............. 750V

Recommended Operating Conditions
Supply voltage (V_IN) .......................... 2.5V to 6V
Output voltage (V_OUT) .................. 1.2V
Operating junction temp (T_J) .... -40°C to +125°C

Thermal Resistance (3) \( \theta_{JA} \) \( \theta_{JC} \)
QFN-12 (2.5mmx3.0mm) .......................... 65° to 13° C/W

Notes:
1) Exceeding these ratings may damage the device.
2) The maximum allowable power dissipation is a function of the maximum junction temperature T_J (MAX), the junction-to-ambient thermal resistance \( \theta_{JA} \), and the ambient temperature T_A. The maximum allowable continuous power dissipation at any ambient temperature is calculated by:
   \[ P_{D}(MAX) = \frac{(T_J (MAX) - T_A)}{\theta_{JA}} \]
   Exceeding the maximum allowable power dissipation produces an excessive die temperature, causing the device to go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
3) Measured on JESD51-7, 4-layer PCB.

FUNCTIONAL BLOCK DIAGRAM

Figure 1: Functional Block Diagram
OPERATION

The MPM3805B’s integrated inductor simplifies the schematic and layout design. Only input and output capacitors are required to complete the design. The MPM3805B uses constant-on-time (COT) control with input voltage feed forward to stabilize the switching frequency over the full input range. At light-load, the device employs proprietary control of the low-side switch and inductor current to improve efficiency. It is available in a small, surface-mounted QFN-12 (2.5mmx3.0mmx0.9mm) package.

Constant-On-Time Control (COT)

Compared to fixed-frequency pulse-width modulation (PWM) control, constant-on-time control (COT) offers a simpler control loop and faster transient response. Using input voltage feed forward, the MPM3805B maintains a nearly constant switching frequency across the input and output voltage range.

The on time of the switching pulse can be estimated with Equation (1):

\[ t_{\text{ON}} = \frac{V_{\text{OUT}}}{V_{\text{IN}}} \times 0.28 \mu\text{s} \]

(1)

To prevent inductor current runaway during the load transition, the MPM3805B fixes the minimum off time to 60ns. However, this time limit does not affect operation in a steady state.

The MPM3805B works in forced continuous conduction mode (CCM).

Enable (EN)

If the input voltage exceeds the under-voltage lockout (UVLO) threshold (typically 2.3V), the MPM3805B is enabled by pulling EN above 1.2V. Float EN floating or pull it to ground to disable the MPM3805B. There is an internal 1MΩ resistor from EN to ground.

Soft Start (SS)

The MPM3805B has a built-in soft start that ramps up the output voltage in a controlled slew rate. This avoids overshoot at start-up. The soft-start time is about 1.5ms.

Power Good Indicator (PGOOD)

The MPM3805B has an open drain with a 550kΩ pull-up resistor pin for the power good indicator (PGOOD). When the feedback voltage (V_{FB}) is within ±10% of the regulation voltage (e.g. 0.6V), PGOOD is pulled up to IN by the internal resistor. If V_{FB} is out of the ±10% window, PGOOD is pulled down to ground by an internal MOSFET. The MOSFET has a maximum R_{DS(on)} below 400Ω.

Current Limit

The MPM3805B has a typical 2.1A current limit for the high-side switch. When the high-side switch reaches the current limit, the MPM3805B reaches the hiccup threshold until the current decreases. This prevents the inductor current from continuing to build, which could damage to the components.

Short Circuit and Recovery

The MPM3805B enters short-circuit protection (SCP) mode when the current limit is reached. It tries to recover from the short circuit with hiccup mode. When an SCP condition occurs, the MPM3805B disables the output power stage, discharges the soft-start capacitor, then automatically tries to soft start again. If the short-circuit condition remains after the soft start ends, The MPM3805B repeats the cycle until the short circuit disappears, and the output rises back to the regulation level.
APPLICATION INFORMATION

COMPONENT SELECTION

Selecting the Input Capacitor
The step-down converter has a discontinuous input current, and requires a capacitor to supply the AC current while maintaining the DC input voltage. For optimal performance, use low-ESR capacitors. Ceramic capacitors with X5R or X7R dielectrics are highly recommended due to their low ESR and small temperature coefficients. For most applications, a 10μF capacitor is sufficient. For an output capacitor, a 22μF capacitor may be needed to enhance system stability.

Since the input capacitor absorbs the input switching current, it requires an adequate ripple current rating. The RMS current in the input capacitor can be estimated with Equation (2):

\[ I_{C1} = \frac{I_{LOAD}}{2} \]  

The worst-case condition occurs at \( V_{IN} = 2V_{OUT} \), calculated with Equation (3):

\[ I_{C1} = \frac{I_{LOAD}}{2} \]  

For simplification, choose an input capacitor that has an RMS current rating greater than half of the maximum load current.

The input capacitor can be electrolytic, tantalum or ceramic. When using electrolytic or tantalum capacitors, add a small, high-quality ceramic capacitor (e.g. 0.1μF) as close to the IC as possible. When using ceramic capacitors, ensure that they have enough capacitance to provide sufficient charge to prevent an excessive voltage ripple at the input. The input voltage ripple caused by capacitance can be estimated with Equation (4):

\[ \Delta V_{IN} = \frac{I_{LOAD}}{f_{SW} \times C_1} \times \frac{V_{OUT}}{V_{IN}} \times \left(1 - \frac{V_{OUT}}{V_{IN}}\right) \]  

Selecting the Output Capacitor
The output capacitor (\( C_{OUT} \)) is required to maintain the DC output voltage. Ceramic capacitors are recommended. Low-ESR capacitors are recommended to maintain a low output voltage ripple. The output voltage ripple can be calculated with Equation (5):

\[ \Delta V_{OUT} = \frac{V_{OUT}}{f_{SW} \times L_1} \times \left(1 - \frac{V_{OUT}}{V_{IN}}\right) \times R_{ESR} + \frac{1}{8 \times f_s \times C_2} \]  

Where \( L_1 \) is the inductor value, and \( R_{ESR} \) is the equivalent series resistance (ESR) value of the output capacitor (\( L_1 \) is 0.47μH).

When using ceramic capacitors, the capacitance dominates impedance at the switching frequency, and causes most of the output voltage ripple. For simplification, the output voltage ripple can be estimated with Equation (6):

\[ \Delta V_{OUT} = \frac{V_{OUT}}{8 \times f_{SW} \times L_1 \times C_2} \times \left(1 - \frac{V_{OUT}}{V_{IN}}\right) \]  

When using tantalum or electrolytic capacitors, the ESR dominates the impedance at the switching frequency. For simplification, the output ripple can be calculated with Equation (7):

\[ \Delta V_{OUT} = \frac{V_{OUT}}{f_{SW} \times L_1} \times \left(1 - \frac{V_{OUT}}{V_{IN}}\right) \times R_{ESR} \]  

The characteristics of the output capacitor affect the stability of the regulation system.

PCB Layout Guidelines
Efficient PCB layout is critical for stable operation. The device’s integrated inductor simplifies the schematic and layout design. Input and output capacitors are required to complete the design. For the best results, refer to Figure 3 and Figure 4 and follow the guidelines below:

1. Place the high-current paths (PGND, IN and OUT) close to the device with short, direct, and wide traces.
2. Place the input capacitor as close to IN and PGND as possible.
3. Keep the switching node away from the feedback network.

For additional device applications, refer to the related evaluation board datasheets.
