

DESCRIPTION

The MPM54532 is a dual 6A power module that integrates a high-efficiency, step-down DC/DC converter IC, two inductors, and selected passive components in an over-molded package.

The two outputs of the MPM54532 can be paralleled for up to 12A current. Active current balancing enables equal current sharing for the outputs in parallel operation.

The MPM54532 offers a dedicated, configurable low-dropout (LDO) regulator with up to typical 500mA of output current (I_{OUT}).

The MPM54532 adopts constant-on-time (COT) control to provide fast transient response and minimize output capacitance.

The MPM54532 provides on-chip non-volatile memory (NVM) to store and restore device configurations. Operation parameters, timing, and protection thresholds are configurable via the I²C bus. The MPM54532 offers on-chip current and voltage sensing for accurate input voltage (V_{IN}), output voltage (V_{OUT}), I_{OUT} , and temperature telemetry via the I²C bus.

The MPM54532 is available in an ultra-thin ECLGA (5mmx5.5mmx1.94mm) package.

FEATURES

- 2.9V to 16V Input Voltage (V_{IN}) Range
- 0.3V to 1.8V Output Voltage (V_{OUT}) Range
- Dual 6A and Up to 12A for Parallel Mode
- MODE Pin to Select V_{OUT} , Parallel Mode, and Timing via Pin-Strapping
- Remote Sense for Both Output Channels
- Configurable, Typically 500mA-Rated Low-Dropout (LDO) Regulator with Input Voltage Up to 3.6V
- Configurable Soft Start, Soft Shutdown, and Delay with FLEX-Timer Sequence Control
- Configurable Reference Voltage (V_{REF}) and Slew Rate
- Configurable Switching Frequency (f_{SW}): 500kHz, 750kHz, 1MHz, and 1.25MHz
- Accurate V_{OUT} , Output Current (I_{OUT}), and Junction Temperature (T_J) Telemetry
- Open-Drain Power Good (PG) Indication and General Status Interrupt
- Ultra-Thin ECLGA (5mmx5.5mmx1.94mm) Package

APPLICATIONS

- Storage and Networking
- FPGA and ASIC Power Supplies
- Computing and Telecommunication

All MPS parts are lead-free, halogen-free, and adhere to the RoHS directive. For MPS green status, please visit the MPS website under Quality Assurance. "MPS", the MPS logo, and "Simple, Easy Solutions" are trademarks of Monolithic Power Systems, Inc. or its subsidiaries.

TYPICAL APPLICATION

ORDERING INFORMATION

Part Number*	Package	Top Marking	MSL Rating
MPM54532GPB-xxxx**	ECLGA (5mmx5.5mmx1.94mm)	See Below	3
MPM54532GPB-0000**	ECLGA (5mmx5.5mmx1.94mm)	See Below	3

* For Tray, add suffix -T (e.g. MPM54532GPB-xxxx-T).

** “xxxx” is the configuration code identifier for the register setting stored in the NVM. The default code is “0000”. Each “x” can be a hexadecimal value between 0 and F. Work with an MPS FAE to create this unique number, even if ordering the “0000” code. The MPM54532GPB-0000 is the default version.

TOP MARKING

LLLLLLL

M

MPS: MPS prefix
YY: Year code
WW: Week code
MP54532: Part number
LLLLLLL: Lot number
M: Module

PACKAGE REFERENCE

PIN FUNCTIONS

Pin #	Name	Description
1, 2	VOUT1	Output of buck converter 1 (buck 1). Make the VOUT1 connection with a wide PCB trace.
8, 9	VOUT2	Output of buck converter 2 (buck 2). Make the VOUT2 connection with a wide PCB trace.
3	BST1	Buck 1 bootstrap. Float the BST1 pin.
22	SW1	Buck 1 switching node. Float the SW1 pin.
4, 5, 6, 21	GND	Power ground. Connect GND with wide copper traces, and place sufficient vias on the ground plane for improved thermal performance.
20	SW2	Buck 2 switching node. Float the SW2 pin.
7	BST2	Buck 2 bootstrap. Float the BST2 pin.
10	CLK	Clock pin for FLEX-time control.
11	EN	Enable pin for buck 1, buck 2, and the low-dropout (LDO) regulator. Pull the EN pin high to enable the power module.
12	FB2P	Positive feedback for buck 2's remote sense. Connect the FB2P pin to GND for dual-phase operation.
13	FB2N	Negative feedback for buck 2's remote sense. Connect the FB2N pin to GND for dual-phase operation.
14	AGND	Analog ground. Connect AGND to GND via a single-point connection.
15	VCC	Internal 3.6V LDO output. Decouple the VCC pin with a 1μF ceramic capacitor. Place the decoupling capacitor as close to the VCC pin as possible.
16	PG	Power good output, open drain. The PG pin pulls low when any enabled regulator falls below the under-voltage (UV) threshold and/or all regulators are disabled.
17, 18	INT	General status interrupt. The INT pin is an open-drain output. The power module asserts INT low to communicate any one (or more) critical event(s) to the host. INT remains asserted until the appropriate registers are explicitly cleared, or the power module is reset. Float this pin if it is not used.
19, 34	VIN2	Buck 2 supply voltage. Ceramic capacitors are required to decouple the input rail. Connect VIN2 using a wide PCB trace. VIN1 and VIN2 must be connected to the same bus voltage.
23, 33	VIN1	Buck 1 supply voltage. Ceramic capacitors are required to decouple the input rail. Connect VIN1 using a wide PCB trace. VIN1 and VIN2 must be connected to the same bus voltage.
24, 25	SCL	I²C bus clock. SCL supports a 1.8V/3.3V bus voltage. If SCL is not used, pull it up to VCC.
26	SDA	I²C bus data. SDA supports a 1.8V/3.3V bus voltage. If SDA is not used, pull it up to VCC.
27	MODE	Mode selection pin. Connect a resistor to this pin to select internal non-volatile memory (NVM) configurations. See the MODE-Determined MTP Configuration section on page 17 for more details.
28	GPIO	GPIO pin. The GPIO pin can be configured into the start-up sequence with the regulators or an analog input for the analog-to-digital converter (ADC) circuit. Float this pin if it is not used.
29	FB1N	Negative feedback for buck 1's remote sense.
30	FB1P	Positive feedback for buck 1's remote sense.
31	LDO	LDO output. This LDO is rated for typical 500mA of output current. Float this pin if the LDO is not used.
32	LDOIN	LDO input. The LDOIN pin's voltage should be below 3.6V. Float this pin if the LDO is not used.

ABSOLUTE MAXIMUM RATINGS ⁽¹⁾

Supply voltage ($V_{IN1/2}$)	18V
$V_{SW1/2}$	-0.3V to $V_{IN} + 0.3V$
$V_{BST1/2}$	$V_{SW1/2} + 4V$
All other pins	-0.3V to +4V
Continuous power dissipation ($T_A = 25^{\circ}C$) ⁽²⁾	
ECLGA (5mmx5.5mm)	6.28W
Junction temperature (T_J)	150°C
Lead temperature	260°C
Storage temperature	-65°C to +150°C

Recommended Operating Conditions ⁽³⁾

Supply voltage ($V_{IN1/2}$)	2.9V to 16V
Output voltage (V_{OUT})	0.3V to 1.8V
Input and output voltage (LDO)	3.6V max
Output current (LDO)	500mA typical
Operating junction temp (T_J)	-40°C to +125°C

Thermal Resistance ^{(4) (5) (6) (7)}

ECLGA (5mmx5.5mmx1.94mm)	
θ_{JA}	19.9°C/W
θ_{JC_TOP}	0.97°C/W
θ_{JB}	14.8°C/W

Notes:

- Exceeding these ratings may damage the device.
- The maximum allowable power dissipation is a function of the maximum junction temperature, T_J (MAX), the junction-to-ambient thermal resistance, θ_{JA} , and the ambient temperature, T_A . The maximum allowable continuous power dissipation at any ambient temperature is calculated by P_D (MAX) = $(T_J$ (MAX) - T_A) / θ_{JA} . Exceeding the maximum allowable power dissipation can produce an excessive die temperature.
- The device is not guaranteed to function outside of its operating conditions.
- θ_{JA} is the junction-to-ambient thermal resistance, θ_{JC_TOP} is the junction-to-case top thermal characterization parameter, and θ_{JB} is the junction-to-board thermal characterization parameter.
- The thermal parameter is based on testing on an MPS evaluation board (EVM54532-PB-00A) under no airflow cooling conditions in a standard enclosure. The board size is 8cmx8cm, 4 layers, of which top and bottom layer copper thickness is 2oz.
- The junction-to-case top thermal characterization parameter (θ_{JC_TOP}) estimates the junction temperature in the real system, based on equation $T_J = \theta_{JC_TOP} \times P_{LOSS} + T_{CASE_TOP}$, where P_{LOSS} is the entire loss of module at real application, and T_{CASE_TOP} is case top temperature.
- The junction-to-board thermal characterization parameter, (θ_{JB}) is the estimation of the junction temperature in the real system, based on equation $T_J = \theta_{JB} \times P_{LOSS} + T_{BOARD}$, where P_{LOSS} is the entire loss of module in a real application, and T_{BOARD} is the board temperature.

ELECTRICAL CHARACTERISTICS

V_{IN} = 12V, T_J = -40°C to +125°C ⁽⁸⁾, typical value is tested at T_J = 25°C, unless otherwise noted.

Parameter	Symbol	Conditions	Min	Typ	Max	Units
VIN						
Input voltage (V _{IN}) under-voltage lockout (UVLO) rising threshold	V _{INUVLO_R}	Configurable via register 0x04, bits[1:0]	2.6	2.75	2.9	V

FUNCTIONAL BLOCK DIAGRAM

Figure 1: Functional Block Diagram

OPERATION

High-Efficiency Buck Regulators

The MPM54532 is a dual-channel power module. Buck converter 1 (buck 1) and buck converter 2 (buck 2) are synchronous, step-down DC/DC converters with built-in soft start, compensation, and hiccup current-limit protection. Fixed-frequency constant-on-time (COT) control provides fast transient response.

VIN Power Supply

VIN1 is the power supply for buck 1, while VIN2 is the power supply for buck 2. VIN1 and VIN2 are connected together internally; it is recommended to connect VIN1 to VIN2 during application. When the input voltage (V_{INx} , where $x = 1$ or 2) exceeds the V_{INx} under-voltage lockout (UVLO) rising threshold, the corresponding buck starts up if all the other start-up conditions are met. The respective buck shuts down when V_{INx} falls below the V_{INx} UVLO falling threshold voltage.

Over-Temperature (OT) Warning and Thermal Shutdown

The MPM54532 employs over-temperature (OT) warning and critical temperature shutdown. The MPM54532 monitors the IC's junction temperature (T_J). If T_J exceeds the OT warning threshold MPM54532 set via register 0x0F, bits[4:2], the MPM54532 sets the warning status in register 0x19, bit[1]. The MPM54532 continues to operate as normal.

If the MPM54532's temperature exceeds the threshold set via register 0x0F, bits[7:5], the MPM54532 internally generates a disable command and disables buck 1, buck 2, and the typical 500mA low-dropout (LDO) regulator. In addition, the OT status in register 0x19, bit[0] is set, and the PG output signal de-asserts at the same time.

Soft Start and Soft Shutdown

The MPM54532 employs a soft-start and soft-shutdown mechanism to ensure that there is a smooth output during start-up and shutdown. When the part is enabled and the BST voltage reaches its rising threshold, the internal digital-to-analog converter (DAC) outputs a reference voltage (V_{REF}). The output voltage (V_{OUTx} , where $x = 1$ or 2) smoothly ramps up with the reference voltage. When the DAC output

reaches the final voltage, it stops at that level. At this point, soft start is finished and the device enters steady-state operation.

When the part is disabled, the internal DAC output ramps down. V_{OUTx} smoothly ramps down with the reference voltage. When the DAC output reaches 300mV (if BUCK1_FB_HALF = 1 or BUCK2_FB_HALF = 1, the corresponding DAC output reaches 150mV), it stops at that level. At this point, soft shutdown is finished and the output gradually discharges to 0V via the FB1P- and FB2P-to-GND resistance.

The soft-start time and soft-shutdown time can be configured via registers 0x41 and 0x48.

Over-Voltage Protection (OVP)

An output over-voltage protection (OVP) mechanism is implemented to limit the voltages on the MPM54532's output regulators. The MPM54532 actively monitors the output voltage (V_{OUTx}) on each enabled regulator.

The potential OV events for the MPM54532 are listed below:

- Buck 1's output exceeds the threshold set via register 0x05, bits[1:0].
- Buck 2's output exceeds the threshold set via register 0x0A, bits[1:0].

The fault rail's output enters OVP mode once the output voltage exceeds the set regulation voltage for longer than 2.5 μ s. In OVP discharge mode, the low-side MOSFET (LS-FET) turns on and stays on until its current drops to the negative current limit. This process discharges the output and keeps the output voltage within the normal range. If the OV condition still exists, the LS-FET turns on again after a fixed delay to repeat the discharge behavior. The device exits discharge mode when the feedback voltage (V_{FB}) drops to the reference voltage threshold.

Over-Current Protection (OCP) and Short-Circuit Protection (SCP)

The MPM54532 has valley current limit control. When the LS-FET is on, the inductor current is monitored.

The potential over-current (OC) events for the MPM54532 are listed below:

- Buck 1's inductor current exceeds the valley current limit threshold set via register 0x04, bits[4:2].
- Buck 2's inductor current exceeds the valley current limit threshold set via register 0x09, bits[4:2].

When the sensed inductor current exceeds the valley current limit threshold, the device enters over-current protection (OCP) mode. The high-side MOSFET (HS-FET) cannot turn on until the inductor current drops to the valley current limit. Meanwhile, the $V_{OUT1/2}$ drops until it falls below the under-voltage (UV) threshold, which is typically 45% of the reference voltage.

If a UV and OC condition are both triggered, the MPM54532 enters hiccup mode to periodically restart the related power rail. The hiccup duty cycle is very small to reduce power dissipation during short-circuit (SC) conditions. During OCP, the device tries to recover from the OC fault with hiccup mode. During this period, the chip disables the output power stage, discharges the soft-start capacitor, and then automatically tries to soft start again. If the OC condition still exists when soft start is finished, the device repeats this operation. OCP is a non-latch protection.

Active Voltage Position (AVP)

The MPM54532 supports active voltage positioning (AVP) by setting the AVP_EN bit to 1 via the I²C. An internal current-sense circuit produces the droop current's (I_{DROOP}) current source, which is proportional to the internal sensing current. I_{DROOP} injects to the FB pin to produce the feedback voltage with a droop voltage. The actual output voltage (V_{OUT_AVP}) can be calculated with Equation (1):

$$V_{OUT_AVP} = V_{OUT} + AVP \times _OFFSET - AVP \times _GAIN \times I_{OUT} \times FB_FACTOR \quad (1)$$

Where V_{OUT} is the output voltage when the AVP function is disabled, and FB_FACTOR is a constant that is determined by BUCKx_FB_HALF (see Table 1). AVPx_GAIN and AVPx_OFFSET can be set via the I²C registers 0x1F and 0x20, respectively. These values can also be pre-configured to the MTP via registers 0x5C and 0x5D, respectively.

Table 1: FB_FACTOR Selection

BUCKx_FB_HALF ⁽¹⁰⁾	FB_FACTOR
0	1
1	2

Note:

10) BUCKx_FB_HALF can be configured via bit[5] of the MTP registers 0x44 and 0x4B, as well as bits[7:6] of the MODE registers 0x72, 0x7D, 0x88, 0x93, 0x9E, 0xA9, 0xB4, and 0xBF.

Power Good (PG) Signal

The PG pin indicates the statuses of V_{INx} and all enabled output regulators (VOUT1, VOUT2, and LDO). The MPM54532 floats the PG pin (meaning it is high) when V_{INx} is valid and all enabled output regulator's (VOUT1, VOUT2, LDO) tolerances are maintained, as configured in the appropriate register space.

When the output voltages of the power rail for VOUTx and LDO are within the power good tolerance threshold, the bits for the internal power good register (register 0x21, bits[6:4]) assert (go high). If the output voltages of the power rail for VOUTx and LDO are out of the power good tolerance thresholds, the internal power good bits de-assert (go low).

The power good status of all the enabled power rails is determined following "and" logic. If all the enabled rails have a high PG status, the PG pin is high. If one or more enabled rails have a low PG status, or all the power rails are disabled, the PG pin is low.

Interleaving for Dual Phase Operation

When interleaving mode is enabled (by setting register 0x54, bit[7] = 1), buck 1 and buck 2 enter 2-phase interleaving operation, which is also known as dual-phase mode. The SET signal is triggered by comparing the FB signal (V_{FB}) and internal reference signal (V_{REF}). When the SET signal goes high, only one phase's PWM output goes high; the next time the SET signal goes high, the next phase's PWM output goes high. This process accomplishes interleaving.

When buck 1 and buck 2 operate in dual-phase interleaving mode, the MPM54532 senses both phase currents and auto-tunes the buck's on time (t_{ON}) to balance the current. Figure 2 on page 17 shows dual-phase operation.

Figure 2: Buck 1/2 Interleaving for Dual-Phase Operation

Analog-to-Digital Converter (ADC)

The MPM54532 supports an analog-to-digital converter (ADC) to monitor the input supply voltages, output voltages (for buck 1, buck 2, the LDO, and GPIO), and output voltage regulator current (for buck 1 and buck 2). Register 0x10, bit[7] enables the ADC. Registers 0x12, 0x13, 0x14, 0x15, 0x16, 0x17, and 0x18 provide the actual measurements for V_{OUT1} , I_{OUT1} , V_{OUT2} , I_{OUT2} , LDO, GPIO, and V_{IN} , respectively.

MODE Pin-Determined MTP Configuration

Some MTP configurations are determined by the resistor connected to the MODE pin. A 2% (or higher) accuracy is required for the MODE resistor to guarantee correct MODE configurations. Table 2 shows the configuration selections.

Table 2: Recommended MODE Resistors for MTP Configurations

MODE Resistor	MODE-Determined MTP Configuration
0Ω	MODE0 (0x70~0x7A)
7.87kΩ	MODE1 (0x7B~0x85)
16.5kΩ	MODE2 (0x86~0x90)
30kΩ	MODE3 (0x91~0x9B)
51kΩ	MODE4 (0x9C~0xA6)
75kΩ	MODE5 (0xA7~0xB1)
100kΩ	MODE6 (0xB2~0xBC)
No connection or VCC	MODE7 (0xBD~0xC7)

After start-up, if $MODE_EN = 1$, the MPM54532 detects the MODE pin's resistor configuration, and selects the corresponding MODEx. Next, the MODEx configurations are loaded into the corresponding MTP registers, and then into the I²C registers.

Otherwise, if $MODE_EN = 0$, the MTP registers maintain their original values, which are loaded into the I²C registers.

I²C Address Configuration

The I²C address is determined by register 0x60, bits[6:0]. After start-up, if $MODE_EN = 1$, the MPM54532 detects the MODE pin's resistor configuration, and selects the corresponding MODEx. The 3-bit register (I2C_ADDRESS) in the MODE register region substitutes 0x60, bits[2:0]; the newly selected 0x60, bits[6:0] becomes the current I²C address.

For example, set register 0x60, bits[6:0] = 0011000, and set register 0x98, bits[4:2] = 011. When the MPM54532 selects Mode 3 via the MODE pin's resistor, register 0x60, bits[2:0] is substituted by 0x98, bits[4:2]. This means that the new value for register 0x60, bits[6:0] = 0011011, which is the current I²C address.

Interrupt (INT)

The INT pin indicates the MPM54532's status. INT is specified as an open-drain signal. Interrupts have an active low latched signal. If any status bit in register 0x19 or 0x1A is changed to 1, the INT pin outputs low.

The INT pin stays low until both of the following requirements are met:

- The condition causing the interrupt no longer persists.
- The register is cleared through the I²C write-to-clear bit.

A status bit is latched to 1 if its related condition occurs. This bit stays latched to 1 until the clear bit is written to 1. If a status bit is cleared but the condition continues to persist, a new interrupt is generated (as if it is a new condition).

When the mask register bit is set to 1 (masked), the INT pin does not pull low, even though the corresponding status bit is triggered and set to 1.

FLEX-Timer Sequence Control

CLK Based Power Sequence Control

The CLK-based FLEX-timer sequence control scheme uses an initiator-target structure. The EN pins and CLK pins for all the PMICs are connected together for sequence control (see Figure 4 on page 18).

The CLK pins are pulled up to any one of the VCCs via a resistor (typically 10kΩ).

One PMIC is configured as the initiator PMIC, which generates a clock signal output on the CLK pin (denoted as PMIC1 in Figure 3). The other PMICs are configured as the target PMICs, which receive the clock signal input on the CLK pin. The start-up/shutdown sequence of all the power rails are synchronized by the clock signal.

Figure 3: FLEX-Timer Sequence Control Connection

When the EN pin pulls high, the start-up sequence starts. The initiator PMIC starts generating the clock outputs, and the target PMICs count the clock signal. For the relevant power rail in one initiator/target PMIC, when the counted clock signal cycle reaches **POWER_ON_DELAY** (an internal NVM register), the power rail turns on. When the initiator PMIC clock cycle reaches **CLK_NUMBER** (an NVM register in the initiator PMIC) and PG goes high (all enabled power rails finish their soft-start process and the PG pin is pulled high by an external resistor), the initiator PMIC stops the clock output, and the start-up sequence finishes. The initiator PMIC does not stop the clock outputs if the PG pin is floating or pulled down.

When the EN pin is pulled low, the shutdown sequence starts, and the initiator PMIC starts generating the clock outputs. The target PMICs count the clock signal. For the relevant power rail in one initiator/target PMIC, when the counted clock signal cycle reaches **POWER_OFF_DELAY** (an internal NVM register), the power rail turns off. When the initiator PMIC clock cycle reaches **CLK_NUMBER**, the initiator PMIC stops the clock output, and the shutdown sequence finishes.

Clock Pausing Function

Consider the following for each initiator/target PMIC during the start-up/shutdown procedure:

- If **CLK_PAUSE_EN = 1**, the initiator/target PMIC pulls the CLK pin down during the soft start/shutdown of any power rail(s). Figure 4 shows when CLK pauses during start-up. Figure 5 shows when CLK pauses during soft shutdown.

Figure 4: Soft Start when CLK Pulls Down (Pausing)

Figure 5: Soft Shutdown when CLK Pulls Down (Pausing)

- If **CLK_PAUSE_EN = 0**, the initiator/target PMIC does not pull the CLK pin down during the soft start/shutdown of any power rails. Figure 6 shows soft start when CLK does not pull down. Figure 7 shows soft shutdown when CLK does not pull down.

Figure 6: Soft Start when CLK Does Not Pull Down (Not Pausing)

Figure 7 Soft Shutdown when CLK Does Not Pull Down (Not Pausing)

- If **CLK_ON_ERROR_PAUSE_EN = 1**, the initiator/target PMIC pulls the CLK pin down if any error occurs during any power rail's soft start (see Figure 8 on page 19).

Figure 8: Soft Start during PMIC Error when CLK Pulls Down (CLK Pausing)

- If CLK_ON_ERROR_PAUSE_EN = 0, the initiator/target PMIC does not pull the CLK pin down, even if any error occurs during the soft start of any power rails (see Figure 9).

Figure 9: Soft Start during PMIC Error when CLK Does Not Pull Down (No CLK Pausing)

Meanwhile, the initiator PMIC generates a clock signal and monitors the CLK pin's status. When the initiator PMIC generates a clock high signal (open-drain output) on the CLK pin but the CLK pin stays low, the CLK pin must be pulled low by one or more initiator/target PMIC(s). The initiator PMIC pauses the clock signal output until the CLK pin is released or detected to be high. If the CLK pin is not pulled low for clock pausing, the initiator PMIC should maintain the clock signal's output until the start-up or shutdown sequence finishes.

I²C INTERFACE

I²C Serial Interface Description

The I²C is a two-wire, bidirectional, serial interface consisting of a data line (SDA) and a clock line (SCL). The lines are pulled to a bus voltage externally when they are idle. When connecting to the line, a initiator device generates the SCL signal and device address, then arranges the communication sequence. The MPM54532's interface is an I²C target. The I²C interface adds flexibility to the power supply solution. The output voltage (V_{OUT}), transition slew rate, and other parameters can be controlled by the I²C interface instantaneously.

Data Validity

One clock pulse is generated for each data bit transferred. The data on the SDA line must be stable during the clock's high period. The high or low state of the data line can only change when the clock signal on the SCL line is low (see Figure 10).

Figure 10: Bit Transfer on the I²C Bus

The start (S) and stop (P) commands are signaled by the initiator device, which signifies the beginning and the end of the I²C transfer. The start command is defined as the SDA signal transitioning from high to low while SCL is high. The stop command is defined as the SDA signal transitioning from low to high while SCL is high (see Figure 11).

Figure 11: Start and Stop Commands

Start and stop commands are always generated by the initiator. The bus is busy after the start condition, and it is considered to be free again a

minimum of 4.7μs after the stop command. The bus remains busy if a repeated start (Sr) is generated instead of a stop command. The start and repeated start commands are functionally identical.

Data Transfer

Every byte put on the SDA line must be 8 bits long. Each byte must be followed by an acknowledge (ACK) bit. The acknowledge-related clock pulse is generated by the initiator. The transmitter releases the SDA line (high) during the acknowledge clock pulse. The receiver must pull down the SDA line during the acknowledge clock pulse so that it remains stable low during the clock pulse's high period.

Figure 12 shows the data transfer format. After the start command, a target address is sent. This address is 7 bits, followed by an 8th data direction bit (R/W). A 0 indicates a transmission (write), and a 1 indicates a request for data (read). A data transfer is always terminated by a stop command, which is generated by the initiator. If the initiator still wants to communicate on the bus, it can generate a repeated start command and address another target without first generating a stop command.

Figure 12: Complete Data Transfer

The MPM54532 requires a start command, a valid I²C address, a register address byte, and a data byte for a single data update. After receiving each byte, the MPM54532 acknowledges by pulling the SDA line low during the high period of a single clock pulse. A valid I²C address selects the MPM54532. The MPM54532 performs an update on the falling edge of the least significant bit (LSB) byte.

Figure 13 on page 21 shows an I²C write example. Figure 14 on page 21 shows an I²C read example.

Figure 13: I²C Write Single Register Example

REGISTER ATTRIBUTE DEFINITION

All volatile registers have base attributes (see Table 3).

Table 3: Register Base Attributes

Attribute	Abbreviation	Description
Read-Only	RO	This bit can be read by the host. Writes have no effect.
Read/Write	R/W	This bit can be read or written by the host.
Write-Only	W	This bit can only be written by the host. Reading from this bit returns 0.
Reserved	RV	This bit is reserved for future expansion and its value must not be modified by the host. The bit returns 0 when read. Writing to this bit has no effect.

Some register attributes can be further modified with attribute modifiers (see Table 4).

Table 4: Register Attribute Modifier

Attribute	Abbreviation	Description
Write 1 Only	1O	This bit can only be set (i.e. write 1) but not reset (i.e. write 0). Writing 0 to this bit has no effect.
Protected	P	This bit is protected by the password registers. This bit cannot be written to unless the password code has been written into the password register(s).
Persistent	E	This bit is persistent during the power cycle.

Table 5 goes into more detail on the register map regions.

Table 5: Register Map Breakdown

Register Range	Region	Description
0x0~0x21	I ² C Region	Volatile memory registers.
0x40~0x64	MTP Region	NVM. These registers require a complete power cycle before they take effect. Changing these registers under normal operation is considered an illegal operation.
0x70~0xC7	MODE Region	NVM. These registers configure the default value for some registers in the MTP region.

I²C REGISTER REGION DESCRIPTION

The I²C registers are volatile memories. These registers directly control PMIC operation.

LOCK (00h)

Format: Unsigned binary

The LOCK command sets the write lock for the I²C registers.

Bits	Access	Bit Name	Default	Description
7:1	R/W	RESERVED	7'b 0000000	Reserved.
0	R/W	I2C_LOCK_EN	1'b 1	Write lock for the I ² C registers. I ² C writing is ineffective when LOCK_EN = 1. 1'b 0: Disabled 1'b 1: Enabled

BUCK1_CTRL1 (01h)

Format: Unsigned binary

The BUCK1_CTRL1 command sets GO_BIT and the slew rate for buck 1's output voltage (V_{OUT1}).

Bits	Access	Bit Name	Default	Description
7	R/W	VOUT1_GO_BIT	1'b 0	VOUT1_GO_BIT is a self-clearing bit. Make the new VOUT1_SETTING configuration, then set VOUT1_GO_BIT = 1 to start dynamic voltage scaling. When V _{OUT1} reaches the new voltage target, VOUT1_GO_BIT is automatically cleared. 1'b 0: Disable changing VOUT1_SETTING 1'b 1: Enable changing VOUT1_SETTING on the fly
6:2	R/W	RV	5'b 00000	Reserved.
1:0	R/W	VOUT1_SLEW_RATE	2'b 00	Sets the V _{OUT1} slew rate during dynamic voltage scaling. 2'b 00: 0.5mV/μs 2'b 01: 1mV/μs 2'b 10: 2mV/μs 2'b 11: 4mV/μs

BUCK1_CTRL2 (02h)

Format: Unsigned binary

The BUCK1_CTRL2 command sets buck 1's operation mode and f_{sw}.

Bits	Access	Bit Name	Default	Description
7:6	R/W	BUCK1_PFM/PWM	2'b 11	Selects buck 1's mode. 2'b 00, 2'b 01: Reserved 2'b 10: Constant-on-time (COT); discontinuous conduction mode (DCM) 2'b 11: COT; forced continuous conduction mode (FCCM)
5:4	R/W	BUCK1_FSW	2'b 01	Sets buck 1's switching frequency. 2'b 00: 500kHz 2'b 01: 750kHz 2'b 10: 1000kHz 2'b 11: 1250kHz
3	R/W	RESERVED	1'b 0	Reserved.
2:0	RW	VOUT1_SETTING_LOW	3'b 000 (Or MODE-Determined)	Combined with VOUT1_SETTING_HIGH to set V _{OUT1} .

BUCK1_CTRL3 (03h)
Format: Direct

The BUCK1_CTRL3 command sets V_{OUT1} .

Bits	Access	Bit Name	Default	Description
7:0	R/W	VOUT1_SETTING_HIGH	8'b 0011 0010 (Or MODE-Determined)	VOUT1_SETTING_HIGH works with VOUT1_SETTING_LOW. By adding these bits together, an 11-bit register controls V_{OUT1}. When BUCK1_FB_HALF = 0: If the bits value $\leq$ 001 0010 1100 (300d), the setting = 300mV. If 001 0010 1100 (300d) $\leq$ the bits value $\leq$ 111 0000 1000 (1800d), then the bits value is defined as equal to X, with the setting = X(mV). 1mV/step. If the bits value $\geq$ 111 0000 1001 (1801d), then these bits are reserved. When BUCK1_FB_HALF = 1: If the bits value $\leq$ 000 1001 0110 (150d), the setting = 300mV. If 000 1001 0110 (150d) $\leq$ the bits value $\leq$ 011 1000 0100 (900d), then the bits value is defined as equal to X, with the setting = 2 x X(mV). 2mV/step. If the bits value $\geq$ 011 1000 0101 (901d), then these bits are reserved.

BUCK1_CTRL4 (04h)
Format: Unsigned binary

The BUCK1_CTRL4 command enables/disable V_{OUT1} discharging and over-voltage protection (OVP), and it sets the over-current (OC) threshold.

Bits	Access	Bit Name	Default	Description
7	R/W	VOUT1_DISCHARGE_EN	1'b 1	Enables buck 1's output passive discharge function. If the passive discharge function is enabled, when buck 1 is disabled, a discharging resistor is connected to the VOUT1_FB_P pin to discharge V_{OUT1} until it reaches 100mV. 1'b 0: Disabled 1'b 1: Enabled
6	R/W	VOUT1_OVP_EN	1'b 1	Enables buck 1's output active OVP function. If output OVP is enabled, buck 1 actively turns on the LS-FET to discharge V_{OUT1}. See the Over-Voltage Protection (OVP) section on page 16 for more details. 1'b 0: Disabled 1'b 1: Enabled
5	R/W	RESERVED	1'b 0	Reserved.
4:2	R/W	BUCK_OC_TH	3'b 101	Sets buck 1's valley current limit threshold. 3'b 000: 4A 3'b 001: 4.5A 3'b 010: 5A 3'b 011: 5.5A 3'b 100: 6A 3'b 101: 6.5A 3'b 110: 7A 3'b 111: 7.5A
1:0	R/W	RESERVED	2'b 00	Reserved.

BUCK1_CTRL7 (05h)

Format: Unsigned binary

The BUCK1_CTRL7 command sets the thresholds for VOUT1_PG_HIGH, VOUT1_PG_LOW, VOUT1_UV, and VOUT1_OV.

Bits	Access	Bit Name	Default	Description
7:6	R/W	VOUT1_PG_VTH_HIGH	2'b 00	Sets V _{OUT1} 's high-side voltage for the power good status. The hysteresis = 2.5%. 2'b 00: +7.5% from VOUT1_SETTING 2'b 01: +10% from VOUT1_SETTING 2'b 10: +12.5% from VOUT1_SETTING 2'b 11: Reserved
5	R/W	VOUT1_PG_VTH_LOW	1'b 0	Sets V _{OUT1} 's low-side voltage threshold for the power good status. The hysteresis = 2.5%. 1'b 0: -7.5% from VOUT1_SETTING 1'b 1: -10% from VOUT1_SETTING
4	R/W	RESERVED	1'b 0	Reserved.
3:2	R/W	VOUT1_UV_VTH	2'b 00	Sets V _{OUT1} 's under-voltage (UV) status threshold. The hysteresis = 2.5%. 2'b 00: -10% from VOUT1_SETTING 2'b 01: -12.5% from VOUT1_SETTING 2'b 10: Reserved 2'b 11: Reserved
1:0	R/W	VOUT1_OV_VTH	2'b 10	Sets V _{OUT1} 's over-voltage (OV) status threshold. The hysteresis = 2.5%. 2'b 00: +8% from VOUT1_SETTING 2'b 01: +10.5% from VOUT1_SETTING 2'b 10: +13% from VOUT1_SETTING 2'b 11: Reserved

BUCK2_CTRL1 (06h)

Format: Unsigned binary

The BUCK2_CTRL1 command sets GO_BIT and the slew rate for buck 2's output voltage (V_{OUT2}).

Bits	Access	Bit Name	Default	Description
7	R/W	VOUT2_GO_BIT	1'b 0	VOUT2_GO_BIT is a self-clearing bit. Make the new VOUT2_SETTING configuration, then set VOUT2_GO_BIT = 1 to start dynamic voltage scaling. When V _{OUT2} reaches the new voltage target, VOUT2_GO_BIT is automatically cleared. 1'b 0: Disable changing VOUT2_SETTING 1'b 1: Enable changing VOUT2_SETTING on the fly
6:2	R/W	RESERVED	5'b 00000	Reserved.
1:0	R/W	VOUT2_SLEW_RATE	2'b 00	Sets the V _{OUT2} slew rate during dynamic voltage scaling. 2'b 00: 0.5mV/μs 2'b 01: 1mV/μs 2'b 10: 2mV/μs 2'b 11: 4mV/μs

BUCK2_CTRL2 (07h)
Format: Unsigned binary

The BUCK2_CTRL2 command sets buck 2's operation mode and f_{sw} .

Bits	Access	Bit Name	Default	Description
7:6	RW	BUCK2_PFM/PWM	2'b 11	Selects buck 2's mode. 2'b 00, 2'b 01: Reserved 2'b 10: Constant-on-time (COT); discontinuous conduction mode (DCM) 2'b 11: COT; forced continuous conduction mode (FCCM)
5:4	RW	BUCK_FSW	2'b 01	Sets buck 2's switching frequency. 2'b 00: 500kHz 2'b 01: 750kHz 2'b 10: 1000kHz 2'b 11: 1250kHz
3	RW	RESERVED	1'b 0	Reserved.
2:0	RW	VOUT2_SETTING_LOW	3'b 000 (Or MODE-Determined)	Combined with VOUT2_SETTING_HIGH to set V_{OUT2} .

BUCK2_CTRL3 (08h)
Format: Direct

The BUCK2_CTRL3 command sets V_{OUT2} .

Bits	Access	Bit Name	Default	Description
7:0	R/W	VOUT2_SETTING_HIGH	8'b 00110010 (Or MODE-Determined)	VOUT2_SETTING_HIGH works with VOUT2_SETTING_LOW. By adding these bits together, an 11-bit register controls V_{OUT2} . When BUCK2_FB_HALF = 0: If the bits value $\leq$ 001 0010 1100 (300d), the setting = 300mV. If 001 0010 1100 (300d) $\leq$ the bits value $\leq$ 111 0000 1000 (1800d), then the bits value is defined as equal to X, with the setting = X(mV). 1mV/step. If the bits value $\geq$ 111 0000 1001 (1801d), then these bits are reserved. When BUCK2_FB_HALF = 1: If the bits value $\leq$ 000 1001 0110 (150d), the setting = 300mV. If 000 1001 0110 (150d) $\leq$ the bits value $\leq$ 011 1000 0100 (900d), then the bits value is defined as equal to X, with the setting = 2 x X(mV). 2mV/step. If the bits value $\geq$ 011 1000 0101 (901d), then these bits are reserved.

BUCK2_CTRL4 (09h)

Format: Unsigned binary

The BUCK2_CTRL4 command enables/disables V_{OUT2} discharge and over-voltage protection (OVP), and it sets the over-current (OC) threshold.

Bits	Access	Bit Name	Default	Description
7	R/W	VOUT2_DISCHRG_EN	1'b 1	Enables buck 2's output passive discharge function. If the passive discharge function is enabled, when buck 2 is disabled, a discharging resistor is connected to the VOUT2_FB_P pin to discharge V_{OUT2} until it reaches 100mV. 1'b 0: Disabled 1'b 1: Enabled
6	R/W	VOUT2_OVP_EN	1'b 1	Enables buck 2's output active OVP function. If output OVP is enabled, buck 2 actively turns on the LS-FET to discharge V_{OUT1} . See the Over-Voltage Protection (OVP) section on page 16 for more details. 1'b 0: Disabled 1'b 1: Enabled
5	R/W	RESERVED	1'b 0	Reserved.
4:2	R/W	BUCK2_OC_TH	3'b 101	Sets buck 2's valley current limit threshold. 3'b 000: 4A 3'b 001: 4.5A 3'b 010: 5A 3'b 011: 5.5A 3'b 100: 6A 3'b 101: 6.5A 3'b 110: 7A 3'b 111: 7.5A
1:0	R/W	RESERVED	2'b 00	Reserved.

BUCK2_CTRL7 (0Ah)

Format: Unsigned binary

The BUCK2_CTRL7 command sets the thresholds for VOUT2_PG_HIGH, VOUT2_PG_LOW, VOUT2_UV, and VOUT2_OV.

Bits	Access	Bit Name	Default	Description
7:6	R/W	VOUT2_PG_VTH_HIGH	2'b 00	Sets V_{OUT2} 's high-side voltage for the power good status. The hysteresis = 2.5%. 2'b 00: +7.5% from VOUT2_SETTING 2'b 01: +10% from VOUT2_SETTING 2'b 10: +12.5% from VOUT2_SETTING 2'b 11: Reserved
5	R/W	VOUT2_PG_VTH_LOW	1'b 0	Sets V_{OUT2} 's low-side voltage threshold for the power good status. The hysteresis = 2.5%. 1'b 0: -7.5% from VOUT2_SETTING 1'b 1: -10% from VOUT2_SETTING
4	R/W	RESERVED	1'b 0	Reserved.

3:2	R/W	VOUT2_UV_VTH	2'b 00	Sets V _{OUT2} 's under-voltage (UV) status threshold. The hysteresis = 2.5%. 2'b 00: -10% from VOUT2_SETTING 2'b 01: -12.5% from VOUT2_SETTING 2'b 10: Reserved 2'b 11: Reserved
1:0	R/W	VOUT2_OV_VTH	2'b 10	Sets V _{OUT2} 's over-voltage (OV) status threshold. The hysteresis = 2.5%. 2'b 00: +8% from VOUT2_SETTING 2'b 01: +10.5% from VOUT2_SETTING 2'b 10: +13% from VOUT2_SETTING 2'b 11: Reserved

LDO_CTRL1 (0Bh)

Format: Unsigned binary

The LDO_CTRL1 command sets GO_BIT, discharge function, and PG threshold for the low-dropout (LDO) regulator.

Bits	Access	Bit Name	Default	Description
7	R/W	LDO_GO_BIT	1'b 0	1'b 0: Disable changing LDO_SETTING on the fly 1'b 1: Enable changing LDO_SETTING on the fly
6:2	RV	RESERVED	5'b 00000	Reserved.
1	R/W	LDO_DISCHG	1'b 1	1'b 0: Disable LDO discharge 1'b 1: Enable LDO discharge
0	R/W	LDO_PG_VTH	1'b 1	Sets the LDO output threshold voltage for the power good status. The hysteresis = 5%. 1'b 0: -10% from LDO_SETTING 1'b 1: -15% from LDO_SETTING

LDO_CTRL2 (0Ch)

Format: Direct

The LDO_CTRL2 command sets the LDO's output voltage.

Bits	Access	Bit Name	Default	Description
7	R/W	RESERVED	1'b 0	Reserved.
6:0	R/W	LDO_SETTING	7'b 011 1100 (Or MODE-determined)	Sets the LDO's output voltage. 30mV/LSB from 0.6V to 3.6V. All lower settings: Reserved 7'b 001 0100: 600mV 7'b 001 0101: 630mV ... 7'b 111 1000: 3600mV All higher settings: Reserved

SYS_CTRL1 (0Dh)

Format: Unsigned binary

The SYS_CTRL1 command enables the PMIC, VOUT1, VOUT2, LDO, and GPIO.

Bits	Access	Bit Name	Default	Description
7	R/W	PMIC_EN	1'b 1	1'b 0: Buck 1, buck 2, and the LDO are all disabled 1'b 1: Buck 1, buck 2, and the LDO are all enabled (must enable each regulator)

6	R/W	VOUT1_EN	1'b 1	1'b 0: Disable buck 1 1'b 1: Enable buck 1
5	R/W	VOUT2_EN	1'b 1	1'b 0: Disable buck 2 1'b 1: Enable buck 2
4	R/W	LDO_EN	1'b 0	1'b 0: Disable LDO 1'b 1: Enable LDO
3:2	RV	RESERVED	2'b 00	Reserved.
1:0	R/W	GPIO_CTRL	2'b 10	Sets GPIO's open-drain output control. 2'b 00: The GPIO output is low 2'b 01: GPIO is an analog input for the ADC 2'b 10: GPIO is part of flex-time control and used as the external converter's enable signal. GPIO outputs as an EN signal for the external converter and its on/off sequence can be configured via the 0x57 and 0x58 registers 2'b 11: The GPIO output is floating/high

SYS_CTRL3 (0Eh)

Format: Unsigned binary

The SYS_CTRL3 command sets the VIN_PG threshold and PG mask.

Bits	Access	Bit Name	Default	Description
7:5	R/W	VIN_PG_VTH	3'b 110	Sets the V _{IN} rising threshold for VIN_PG. VIN_PG (0x19) is 0 (power good) even if V _{IN} < V _{IN} PG falling threshold after V _{IN} start-up. Then ramp up V _{IN} to be ≥ V _{IN} rising threshold. If V _{IN} triggers the V _{IN} PG falling threshold again, VIN_PG changes to 1 (power not good). The hysteresis = 0.5V. 3'b 000: 9.5V (same as 001) 3'b 001: 9.5V 3'b 010: 8.5V 3'b 011: 7.5V 3'b 100: 6.5V 3'b 101: 5.5V 3'b 110: 4.25V 3'b 111: Reserved
4	R/W	MASK_PG	1'b 0	Masks the PG pin's behavior. The STATUS register still indicates the PG status. 1'b 0: Not masked 1'b 1: Masked
3:0	R/W	RESERVED	4'b 0001	Reserved.

SYS_CTRL4 (0Fh)

Format: Unsigned binary

The SYS_CTRL4 command sets the over-temperature (OT) threshold and OT warning threshold.

Bits	Access	Bit Name	Default	Description
7:5	R/W	OT_TH	3'b 010	Sets the converter's temperature shutdown threshold. The hysteresis = 20°C. 3'b 000: 125°C 3'b 001: 135°C 3'b 010: 145°C 3'b 011: 155°C 3'b 100: 165°C 3'b 101: Reserved 3'b 110: Reserved 3'b 111: Reserved
4:2	R/W	OTW_TH	3'b 011	Sets the OT warning threshold. The hysteresis = 20°C. 3'b 000: Reserved 3'b 001: 100°C 3'b 010: 110°C 3'b 011: 120°C 3'b 100: 130°C 3'b 101: 140°C 3'b 110: 150°C 3'b 111: Reserved
1:0	R/W	RESERVED	2'b 00	Reserved.

ADC_CTRL1 (10h)

Format: Unsigned binary

The ADC_CTRL1 command sets ADC_EN and ADC_SAMPLE_FREQ.

Bits	Access	Bit Name	Default	Description
7	R/W	ADC_EN	1'b 1	1'b 0: Disable the ADC 1'b 1 : Enable the ADC
6:2	R/W	RESERVED	5'b 00000	Reserved.
1:0	R/W	ADC_SAMPLE_FREQ	2'b 01	Sets the frequency to refresh all the ADC channels. 2'b 00: 4kHz 2'b 01: 2kHz 2'b 10: 1kHz 2'b 11: 0.5kHz

TEMPERATURE (11h)

Format: Unsigned binary

The TEMPERATURE command monitors the IC's temperature.

Bits	Access	Bit Name	Default	Description
7:5	RO	TEMPERATURE	3'b 000	Monitors the PMIC's temperature. 3'b 000: <80°C 3'b 001: 85°C 3'b 010: 95°C 3'b 011: 105°C 3'b 100: 115°C 3'b 101: 125°C 3'b 110: 135°C 3'b 111: >140°C

4:0	R/W	RESERVED	5'b00000	Reserved.
-----	-----	----------	----------	-----------

VOUT1_ADC (12h)

Format: Direct

The VOUT1_ADC command monitors V_{OUT1}.

Bits	Access	Bit Name	Default	Description
7:0	RO	VOUT1_ADC	8'b 00000000	Returns V _{OUT1} . 16mV per LSB. 8'b 0000 0000: Undefined 8'b 0000 0001: 16mV 8'b 0000 0010: 32mV ... 8'b 1111 1110: 4064mV 8'b 1111 1111: ≥4080mV

IOUT1_ADC (13h)

Format: Direct

The IOUT1_ADC command monitors buck 1's output current (I_{OUT1}).

Bits	Access	Bit Name	Default	Description
7:0	RO	IOUT1_ADC	8'b 0000 0000	Returns I _{OUT1} . 50mA per LSB. 8'b 0000 0000: 0A 8'b 0000 0001: 0.05A 8'b 0000 0010: 0.1A ... 8'b 1111 1110: 12.7A 8'b 1111 1111: 12.75A

VOUT2_ADC (14h)

Format: Direct

The VOUT2_ADC command monitors V_{OUT2}.

Bits	Access	Bit Name	Default	Description
7:0	RO	VOUT2_ADC	8'b 0000 0000	Returns V _{OUT2} . 16mV per LSB. 8'b 0000 0000: Undefined 8'b 0000 0001: 16mV 8'b 0000 0010: 32mV ... 8'b 1111 1110: 4064mV 8'b 1111 1111: ≥4080mV

IOUT2_ADC (15h)

Format: Direct

The IOUT2_ADC command monitors buck 2's output current (I_{OUT2}).

Bits	Access	Bit Name	Default	Description
7:0	RO	IOUT2_ADC	8'b0000 0000	Returns I _{OUT2} . 50mA per LSB. 8'b 0000 0000: 0A 8'b 0000 0001: 0.05A 8'b 0000 0010: 0.1A ... 8'b 1111 1110: 12.7A 8'b 1111 1111: 12.75A

LDO_ADC (16h)

Format: Direct

The LDO_ADC command monitors the LDO's output voltage.

Bits	Access	Bit Name	Default	Description
7:0	RO	LDO_ADC	8'b 0000 0000	Sets the LDO's output voltage. 16mV per LSB. 8'b 0000 0000: Undefined 8'b 0000 0001: 16mV 8'b 0000 0010: 32mV ... 8'b 1111 1110: 4064mV 8'b 1111 1111: ≥4080mV

GPIO_ADC (17h)

Format: Direct

The GPIO_ADC command monitors the GPIO output voltage.

Bits	Access	Bit Name	Default	Description
7:0	RO	GPIO_ADC	8'b 0000 0000	Returns the GPIO's output voltage. 8mV per LSB. 8'b 0000 0000: 0mV 8'b 0000 0001: 8mV ... 8'b 1111 1111: 2040mV

VIN_ADC (18h)

Format: Direct

The VIN_ADC command monitors the input voltage.

Bits	Access	Bit Name	Default	Description
7:0	RO	VIN_ADC	8'b 0000 0000	Returns the input voltage. 64mV per LSB. 8'b 0000 0000: 0mV 8'b 0000 0001: 64mV 8'b 0000 0010: 128mV ... 8'b 1111 1111: ≥16320mV

FAULT_STATUS (19h)

Format: Direct

The FAULT_STATUS command monitors the fault statuses of V_{IN}, V_{OUT1}, V_{OUT2}, the LDO, and over-temperature warning (OTW) and OT conditions.

Bits	Access	Bit Name	Default	Description
7	RO	VIN_PG	1'b 0	Indicates V _{IN} 's power good status. 1'b 0: Power good 1'b 1: Power not good
6	RO	VOUT1_PG	1'b 0	Indicates V _{OUT1} 's fault status. If a V _{OUT1} fault occurs, this bit is set and latched. Send a CLEAR1 (1Dh) command to reset this bit. 1'b 0: Normal start-up (or EN is off) 1'b 1: A V _{OUT1} fault has occurred when EN is on

5	RO	VOUT2_PG	1'b 0	Indicates V _{OUT2} 's fault status. If a V _{OUT2} fault occurs, this bit is set and latched. Send a CLEAR1 (1Dh) command to reset this bit. 1'b 0: Normal start-up (or EN is off) 1'b 1: A V _{OUT2} fault has occurred when EN is on
4	RO	LDO_PG	1'b 0	Indicates the LDO's fault status. If an LDO fault occurs, this bit is set and latched. Send a CLEAR1 (1Dh) command to reset this bit. 1'b 0: Power good (or EN is off) 1'b 1: An LDO fault has occurred when EN is on
3:2	R/W	RESERVED	2'b 00	Reserved.
1	RO	OTW	1'b 0	Indicates the over-temperature warning status. 1'b 0: The temperature is below the warning threshold 1'b 1: The temperature exceeds the warning threshold
0	RO	OT	1'b 0	Indicates the temperature shutdown status. 1'b 0: No temperature shutdown has occurred 1'b 1: Temperature shutdown has occurred

STATUS1 (1Ah)

Format: Direct

The STATUS1 command monitors fault statuses of VIN_OV, VIN_UV, VOUT1_OV, VOUT2_OV, VOUT1_UV, VOUT2_UV, VOUT1_OC, and VOUT2_OC.

Bits	Access	Bit Name	Default	Description
7	RO	VIN_OV	1'b 0	Indicates the V _{IN} over-voltage (OV) status. 1'b 0: No OV condition 1'b 1: There is an OV condition
6	RO	VIN_UV	1'b 0	Indicates the V _{IN} under-voltage (UV) status. 1'b 0: No UV condition 1'b 1: There is an UV condition
5	RO	VOUT1_OV	1'b 0	Indicates the V _{OUT1} OV status. 1'b 0: No OV condition 1'b 1: There is an OV condition
4	RO	VOUT2_OV	1'b 0	Indicates the V _{OUT2} OV status. 1'b 0: No OV condition 1'b 1: There is an OV condition
3	RO	VOUT1_UV	1'b 0	Indicates the V _{OUT1} UV status. 1'b 0: No UV condition 1'b 1: There is an UV condition
2	RO	VOUT2_UV	1'b 0	Indicates the V _{OUT2} UV status. 1'b 0: No UV condition 1'b 1: There is an UV condition
1	RO	VOUT1_OC	1'b 0	Indicates buck 1's output current limit warning status. 1'b 0: No current-limit event has occurred 1'b 1: A current-limit event has occurred

0	RO	VOUT2_OC	1'b 0	Indicates buck 2's output current limit warning status. 1'b 0: No current-limit event has occurred 1'b 1: A current-limit event has occurred
---	----	----------	-------	--

MASK1 (1Bh)

Format: Unsigned binary

The MASK1 command masks the INT pin's behavior. The STATUS register still indicates each event.

Bits	Access	Bit Name	Default	Description
7	R/W	VIN_PG_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
6	R/W	VOUT1_PG_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
5	R/W	VOUT2_PG_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
4	R/W	LDO_PG_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
3:2	R/W	RESERVED	2'b 00	Reserved.
1	R/W	OTW_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
0	R/W	OT_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask

MASK2 (1Ch)

Format: Unsigned binary

The MASK2 command masks the INT pin's behavior. The STATUS register still indicates each event.

Bits	Access	Bit Name	Default	Description
7	R/W	VIN_OV_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
6	R/W	VIN_UV_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
5	R/W	VOUT1_OV_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
4	R/W	VOUT2_OV_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
3	R/W	VOUT1_UV_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
2	R/W	VOUT2_UV_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
1	R/W	VOUT1_OC_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
0	R/W	VOUT2_OC_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask

CLEAR1 (1Dh)

Format: Direct

The CLEAR1 command is used to clear corresponding fault bits that have been set.

Bits	Access	Bit Name	Default	Description
7	10	VIN_PG_CLEAR	1'b 0	Clears the V _{IN} power good status. 1'b 1: Clear the status
6	10	VOUT1_PG_CLEAR	1'b 0	Clears the V _{OUT1} power good status. 1'b 1: Clear the status
5	10	VOUT2_PG_CLEAR	1'b 0	Clears the V _{OUT2} power good status. 1'b 1: Clear the status
4	10	LDO_PG_CLEAR	1'b 0	Clears the LDO power good status. 1'b 1: Clear the status
3	10	OTW_CLEAR	1'b 0	Clears the over-temperature (OT) warning status. 1'b 1: Clear the status
2	10	OT_CLEAR	1'b 0	Clears the OT status. 1'b 1: Clear the status
1	10	RESERVED	1'b 0	Reserved.
0	10	ALL_STATUS_CLEAR	1'b 0	1'b 1: Clears all the status bits

CLEAR2 (1Eh)

Format: Direct

The CLEAR2 command clears the corresponding fault bits that have been set.

Bits	Access	Bit Name	Default	Description
7	10	VIN_OV_CLEAR	1'b0	Clears the V _{IN} over-voltage (OV) status. 1'b 1: Clear the status
6	10	VIN_UV_CLEAR	1'b0	Clears the V _{IN} under-voltage (UV) status. 1'b 1: Clear the status
5	10	VOUT1_OV_CLEAR	1'b0	Clears the V _{OUT1} OV status. 1'b 1: Clear the status
4	10	VOUT2_OV_CLEAR	1'b0	Clears the V _{OUT2} OV status. 1'b 1: Clear the status
3	10	VOUT1_UV_CLEAR	1'b0	Clears the V _{OUT1} UV status. 1'b 1: Clear the status
2	10	VOUT2_UV_CLEAR	1'b0	Clears the V _{OUT2} UV status. 1'b 1: Clear the status
1	10	VOUT1_OC_CLEAR	1'b0	Clears buck 1's output current limit warning status. 1'b 1: Clear the status
0	10	VOUT2_OC_CLEAR	1'b0	Clear buck 2's output current limit warning status. 1'b 1: Clear the status

AVP_CTRL1 (1Fh)
Format: Unsigned binary

This AVP_CTRL1 command enables/disables the AVP function for buck 1.

Bits	Access	Bit Name	Default	Description
7	R/W	AVP1_EN	1'b 0	Enables/disables buck 1's AVP function. 1'b 0: Disabled 1'b 1: Enabled
6:5	R/W	AVP1_GAIN	2'b 00	Sets the AVP gain. 2'b 00: 2.6mV/A 2'b 01: 5.7mV/A 2'b 10: 8.6mV/A 2'b 11: 11.3mV/A
4:0	R/W	AVP1_OFFSET	5'b 00001	Sets the DC offset voltage for the output voltage command value when AVP is enabled. This offset ranges between -30mV and +30mV. 2mV per step. AVP1_OFFSET is valid after setting AVP1_EN = 1 and GO_BIT = 1 when changing it on fly. 5'b x0000: 0mV 5'b 00001: 2mV ... 5'b 01111: 30mV 5'b 10001: -2mV ... 5'b 11111: -30mV

AVP_CTRL2 (20h)
Format: Unsigned binary

This AVP_CTRL2 command enables/disables the AVP function for buck 2.

Bits	Access	Bit Name	Default	Description
7	R/W	AVP2_EN	1'b 0	Enables/disables buck 2's AVP function. In dual-phase, single-output mode, this function is invalid. 1'b 0: Disabled 1'b 1: Enabled
6:5	R/W	AVP2_GAIN	2'b 00	Sets the AVP gain. In dual-phase, single-output mode, the AVP2 function is invalid. 2'b 00: 2.6mV/A 2'b 01: 5.7mV/A 2'b 10: 8.6mV/A 2'b 11: 11.3mV/A
4:0	R/W	AVP2_OFFSET	5'b 00001	Sets the DC offset voltage for the output voltage command value when AVP is enabled. This offset ranges between -30mV and +30mV. 2mV per step. AVP2_OFFSET is valid after setting AVP2_EN = 1 and GO_BIT = 1 when changing it on fly. 5'b x0000: 0mV 5'b 00001: 2mV ... 5'b 01111: 30mV 5'b 10001: -2mV ... 5'b 11111: -30mV

STATUS2 (21h)
Format: Direct

The STATUS2 command monitors the statuses of VIN_PG, VOUT1_PG, VOUT2_PG, LDO_PG, OT_WARNING, and OT_FAULT.

Bits	Access	Bit Name	Default	Description
7	R	VIN_PG_STATUS	1'b 0	Indicates the V _{IN} power good status. This is an active bit that does not have to be cleared. 1'b 0: Normal start-up 1'b 1: A V _{IN} fault has occurred
6	R	VOUT1_PG_STATUS	1'b 0	Indicates the V _{OUT1} power good status. This is an active bit that does not have to be cleared. 1'b 0: Normal start-up 1'b 1: V _{OUT1} is not at its target
5	R	VOUT2_PG_STATUS	1'b 0	Indicates the V _{OUT2} power good status. This is an active bit that does not have to be cleared. 1'b 0: Normal start-up 1'b 1: V _{OUT2} is not at its target
4	R	LDO_PG_STATUS	1'b 0	Indicates the LDO power good status. This is an active bit that does not have to be cleared. 1'b 0: Normal start-up 1'b 1: The LDO voltage is not at its target
3:2	R	RESERVED	2'b 00	Reserved.
1	R	OT_WARNING_STATUS	1'b 0	Indicates the over-temperature warning (OTW) status. This is an active bit that does not have to be cleared. 1'b 0: Normal start-up 1'b 1: An OTW has occurred
0	R	OT_FAULT_STATUS	1'b 0	Indicates the OT fault status. This is an active bit that does not have to be cleared. 1'b 0: Normal start-up 1'b 1: An OT fault has occurred

MTP REGISTER REGION

The MTP registers are non-volatile memories. Most of the MTP registers are related to the registers from the I²C. The MTP registers do not directly control the converter's operation. During start-up through VIN, the settings are copied from the MTP registers to the I²C registers.

LOCK (40h)

Format: Direct

The LOCK command sets the MTP region's access password.

Bits	Access	Bit Name	Default	Description
7:0	R/W	MTP_REGION_ACCESS_PASSWORD	8'b 0000 0000	The correct password must be used to access the MTP register region and MODE register region. Contact an MPS FAE for the password.

BUCK1_CTRL1 (41h)

The BUCK1_CTRL1 command sets the default settings for BUCK1_CTRL1 (01h). No direct control on Converter operation except for SOFT START and SOFT STOP.

Bits	Access	Bit Name	Default	Description
7	RW	RESERVED	1'b 0	Reserved.
6:4	R/W	VOUT1_SOFT_START	3'b 001 (Or MODE-Determined)	Sets buck 1's soft-start time after being enabled. The output is between 0% and 100% of V _{OUT1} . 3'b 000: 1ms 3'b 001: 2ms 3'b 010: 4ms 3'b 011: 6ms 3'b 100: 8ms 3'b 101: 10ms 3'b 110: 12ms 3'b 111: 14ms
3:2	R/W	VOUT1_SOFT_STOP	2'b 00	Sets buck 1's soft-shutdown time after being enabled. The output is between 0% and 100% of V _{OUT1} . 2'b 00: 0.5ms 2'b 01: 1ms 2'b 10: 2ms 2'b 11: 4ms
1:0	R/W	VOUT1_SLEW_RATE	2'b 01	Sets V _{OUT1} 's slew rate during dynamic voltage scaling. 2'b 00: 0.5mV/μs 2'b 01: 1mV/μs 2'b 10: 2mV/μs 2'b 11: 4mV/μs

BUCK1_CTRL2 (42h)

The BUCK1_CTRL2 command sets the default setting for BUCK1_CTRL2 (02h). This command does not have direct control of converter operation.

In dual-phase, single-output mode, the BUCK2_FSW, BUCK2_PFM/PWM, and VOUT2 settings are masked internally; instead, these values are determined by buck 1's corresponding setting.

In single-phase, dual-output mode, it is recommended to set BUCK1_FSW and BUCK2_FSW to the same frequency.

Bits	Access	Bit Name	Default	Description
7:6	R/W	BUCK1_PFM/PWM	2'b 11	Selects buck 1's mode. 2'b 00, 2'b 01: Reserved 2'b 10: Constant-on-time (COT); discontinuous conduction mode at light loads 2'b 11: COT; forced continuous conduction mode (FCCM)
5:4	R/W	BUCK_FSW	2'b 01	Sets buck 1's switching frequency. 2'b 00: 500kHz 2'b 01: 750kHz 2'b 10: 1000kHz 2'b 11: 1250kHz
3	R/W	RESERVED	1'b 0	Reserved.
2:0	R/W	VOUT1_SETTING_LOW	3'b 000 (Or MODE-Determined)	Combined with VOUT1_SETTING_HIGH to set V _{OUT1} .

BUCK1_CTRL3 (43h)

The BUCK1_CTRL3 command sets the default setting for BUCK1_CTRL3 (03h). This command does not have direct control of converter operation.

Bits	Access	Bit Name	Default	Description
7:0	R/W	VOUT1_SETTING_HIGH	8'b 0011 0010 (Or MODE-Determined)	VOUT1_SETTING_HIGH works with VOUT1_SETTING_LOW. By adding these bits together, an 11-bit register controls V _{OUT1} . When BUCK1_FB_HALF = 0: If the bits value ≤ 001 0010 1100 (300d), the setting = 300mV. If 001 0010 1100 (300d) ≤ the bits value ≤ 111 0000 1000 (1800d), then the bits value is defined as equal to X, with the setting = X(mV). 1mV/step. If the bits value ≥ 11'b111 0000 1001 (1801d), these bits are reserved. When BUCK1_FB_HALF = 1: If the bits value ≤ 000 1001 0110 (150d), the setting = 300mV. If 000 1001 0110 (150d) ≤ the bits value ≤ 011 1000 0100 (900d), then the bits value is defined as equal to X, with the setting = 2 x X(mV). 2mV/step. If the bits value ≥ 011 1000 0101 (901d), then these bits are reserved. All higher settings = 3800mV

BUCK1_CTRL4 (44h)

The BUCK1_CTRL4 command sets the default setting for BUCK1_CTRL4 (04h). This command does not have direct control of converter operation.

Bits	Access	Bit Name	Default	Description
7	R/W	VOUT1_DISCHRG_EN	1'b 1	Enables buck 1's output passive discharge function. If the passive discharge function is enabled, when buck 1 is disabled, a discharging resistor is connected to the VOUT1_FB_P pin to discharge V _{OUT1} until it reaches 100mV. 1'b 0: Disabled 1'b 1: Enabled
6	R/W	VOUT1_OVP_EN	1'b 1	Enables buck 1's output active OVP function. If output OVP is enabled, buck 1 actively turns on the LS-FET to discharge V _{OUT1} . See the Over-Voltage Protection (OVP) section on page 16 for more details. 1'b 0: Disabled 1'b 1: Enabled
5	R/W	BUCK1_FB_HALF	1'b 0	Enables buck 1's internal FB half divider. 1'b 0: There is no internal FB divider 1'b 1: The internal 1/2 divider for FB divider is enabled
4:2	R/W	BUCK1_OC_TH	3'b 101	Sets buck 1's valley current limit threshold. 3'b 000: 4A 3'b 001: 4.5A 3'b 010: 5A 3'b 011: 5.5A 3'b 100: 6A 3'b 101: 6.5A 3'b 110: 7A 3'b 111: 7.5A
1:0	R/W	RESERVED	2'b 00	Reserved.

BUCK1_CTRL5 (45h)

The BUCK1_CTRL5 command sets buck 1's soft-start delay by counting a set number of CLK pulses.

Bits	Access	Bit Name	Default	Description
7:0	R/W	BUCK1_POWER_ON_DELAY	8'b 0000 0100 (Or MODE-Determined)	Sets buck 1's soft-start delay via CLK pulses. 8'b 0000 0000: 0 8'b 0000 0001: 1 8'b 0000 0010: 2 8'b 0000 0011: 3 ... 8'b 0110 0100: 100 8'b 0110 0101: 102 8'b 0110 0110: 104 ... 8'b 1001 0110: 200 8'b 1001 0111: 204 8'b 1001 1000: 208 ... 8'b 1100 1000: 400 8'b 1100 1001: 408 8'b 1100 1010: 416 ... 8'b 1110 0001: 600 8'b 1110 0010: 616 8'b 1110 0011: 632 ... 8'b 1111 1010: 1000 8'b 1111 1011: 1024 8'b 1111 1100~8'b 1111 1111: Reserved

BUCK1_CTRL6 (46h)

The BUCK1_CTRL6 command sets buck 1's soft-shutdown delay by counting a set number of CLK pulses.

Bits	Access	Bit Name	Default	Description
7:0	R/W	BUCK1_POWER_OFF_DELAY	8'b 0000 0100	Sets buck 1's soft-shutdown delay via CLK pulses. 8'b 0000 0000: 0 8'b 0000 0001: 1 8'b 0000 0010: 2 8'b 0000 0011: 3 ... 8'b 0110 0100: 100 8'b 0110 0101: 102 8'b 0110 0110: 104 8'b 1001 0110: 200 8'b 1001 0111: 204 8'b 1001 1000: 208 ... 8'b 1100 1000: 400 8'b 1100 1001: 408 8'b 1100 1010: 416 ... 8'b 1110 0010: 616 8'b 1110 0011: 632 8'b 1110 0100: 648 ... 8'b 1111 1011: 1024 8'b 1111 1100~1111 1111: Reserved

BUCK1_CTRL7 (47h)

The BUCK1_CTRL7 command sets the default setting for BUCK1_CTRL7 (05h). This command does not have direct control of converter operation.

Bits	Access	Bit Name	Default	Description
7:6	R/W	VOUT1_PVTH_HIGH	2'b 00	Sets V _{OUT1} 's high-side voltage for the power good status. The hysteresis = 2.5%. 2'b 00: +7.5% from VOUT1_SETTING 2'b 01: +10% from VOUT1_SETTING 2'b 10: +12.5% from VOUT1_SETTING 2'b 11: Reserved
5	R/W	VOUT1_PG_VTH_LOW	1'b 0	Sets V _{OUT1} 's low-side voltage threshold for the power good status. The hysteresis = 2.5%. 1'b 0: -7.5% from VOUT1_SETTING 1'b 1: -10% from VOUT1_SETTING
4	R/W	RESERVED	1'b 0	Reserved.
3:2	R/W	VOUT1_UV_VTH	2'b 00	Sets V _{OUT1} 's under-voltage (UV) status threshold. The hysteresis = 2.5%. 2'b 00: -10% from VOUT1_SETTING 2'b 01: -12.5% from VOUT1_SETTING 2'b 10: Reserved 2'b 11: Reserved
1:0	R/W	VOUT1_OV_VTH	2'b 10	Sets V _{OUT1} 's over-voltage (OV) status threshold. The hysteresis = 2.5%. 2'b 00: +8% from VOUT1_SETTING 2'b 01: +10.5% from VOUT1_SETTING 2'b 10: +13% from VOUT1_SETTING 2'b 11: Reserved

BUCK2_CTRL1 (48h)

The BUCK2_CTRL1 command sets the default setting for BUCK2_CTRL1 (06h). No direct control on Converter operation except for SOFT START and SOFT STOP.

Bits	Access	Bit Name	Default	Description
7	R/W	RV	1'b 0	Reserved.
6:4	R/W	VOUT2_SOFT_START	3'b 001 or (Or MODE-Determined)	Sets buck 2's soft-start time after being enabled. The output is between 0% and 100% of V _{OUT2} . 3'b 000: 1ms 3'b 001: 2ms 3'b 010: 4ms 3'b 011: 6ms 3'b 100: 8ms 3'b 101: 10ms 3'b 110: 12ms 3'b 111: 14ms
3:2	R/W	VOUT2_SOFT_STOP	2'b 00	Sets buck 2's soft-shutdown time after being enabled. The output is between 0% and 100% of V _{OUT2} . 2'b 00: 0.5ms 2'b 01: 1ms 2'b 10: 2ms 2'b 11: 4ms

1:0	R/W	VOUT2_SLEW_RATE	2'b 01	Sets V _{OUT2} 's slew rate during dynamic voltage scaling. 2'b 00: 0.5mV/μs 2'b 01: 1mV/μs 2'b 10: 2mV/μs 2'b 11: 4mV/μs
-----	-----	-----------------	--------	---

BUCK2_CTRL2 (49h)

The BUCK2_CTRL2 command sets the default settings for BUCK2_CTRL2 (07h). This command does not have direct control of converter operation. In dual-phase, single-output mode, the BUCK2_FSW, BUCK2_PFM/PWM, and VOUT2 settings are masked; instead, these values are determined by buck 1's corresponding setting.

In single-phase, dual-output mode, it is recommended to set BUCK1_FSW and BUCK2_FSW to the same frequency.

Bits	Access	Bit Name	Default	Description
7:6	R/W	BUCK2_PFM/PWM	2'b 11	Selects buck 2's mode. 2'b 00, 2'b 01: Reserved 2'b 10: Constant-on-time (COT); discontinuous conduction mode (DCM) at light loads 2'b 11: COT; forced continuous conduction mode (FCCM)
5:4	R/W	BUCK_FSW	2'b 01	Sets buck 2's switching frequency. 2'b 00: 500kHz 2'b 01: 750kHz 2'b 10: 1000kHz 2'b 11: 1250kHz
3	R/W	RESERVED	1'b 0	Reserved.
2:0	R/W	VOUT2_SETTING_LOW	3'b 000 (Or MODE-Determined)	Works with VOUT2_SETTING_HIGH to set V _{OUT2} .

BUCK2_CTRL3 (4Ah)

The BUCK2_CTRL3 command sets the default settings for BUCK2_CTRL3 (08h). This command does not have direct control of converter operation.

Bits	Access	Bit Name	Default	Description
7:0	R/W	VOUT2_SETTING_HIGH	8'b 0011 0010 (Or MODE-Determined)	VOUT2_SETTING_HIGH works with VOUT2_SETTING_LOW. By adding these bits together, an 11-bit register controls V _{OUT2} . When BUCK2_FB_HALF = 0: If the bits value ≤ 001 0010 1100 (300d), the setting = 300mV. If 001 0010 1100(300d) ≤ the bits value ≤ 111 0000 1000 (1800d), then the bits value is defined as equal to X, with the setting = X(mV). 1mV/step. If the bits value ≥ 111 0000 1001 (1801d), then these bits are reserved. When BUCK2_FB_HALF = 1: If the bits value ≤ 000 1001 0110 (150d), the setting = 300mV. If 000 1001 0110 (150d) ≤ the bits value ≤ 011 1000 0100 (900d), then the bits value is defined as equal to X, with the setting = 2 × X(mV). 2mV/step. If the bits value ≥ 011 1000 0101 (901d), then these bits are reserved.

BUCK2_CTRL4 (4Bh)

The BUCK2_CTRL4 command sets the default setting for BUCK2_CTRL4 (09h). This command does not have direct control of converter operation.

Bits	Access	Bit Name	Default	Description
7	R/W	VOUT2_DISCHARGE_EN	1'b 1	Enables buck 2's output passive discharge function. If the passive discharge function is enabled, when buck 2 is disabled, a discharging resistor is connected to the VOUT2_FB_P pin to discharge V _{OUT2} until it reaches 100mV. 1'b 0: Disabled 1'b 1: Enabled
6	R/W	VOUT2_OVP_EN	1'b 1	Enables buck 2's output active OVP function. If output OVP is enabled, buck 2 actively turns on the LS-FET to discharge V _{OUT1} . See the Over-Voltage Protection (OVP) section on page 16 for more details. 1'b 0: Disabled 1'b 1: Enabled
5	R/W	BUCK2_FB_HALF	1'b 0	Enables buck 2's internal FB half divider. 1'b 0: There is no internal FB divider 1'b 1: The internal 1/2 divider for FB divider is enabled
4:2	R/W	BUCK2_OC_TH	3'b 101	Sets buck 2's valley current limit threshold. 3'b 000: 4A 3'b 001: 4.5A 3'b 010: 5A 3'b 011: 5.5A 3'b 100: 6A 3'b 101: 6.5A 3'b 110: 7A 3'b 111: 7.5A
1:0	RW	RESERVED	2'b 00	Reserved.

BUCK2_CTRL5 (4Ch)

The BUCK2_CTRL5 command sets buck 2's soft-start delay by counting a set number of CLK pulses.

Bits	Access	Bit Name	Default	Description
7:0	R/W	BUCK2_POWER_ON_DELAY	8'b 0000 0100 (Or MODE-Determined)	Sets buck 2's soft-start delay via CLK pulses. 8'b 0000 0000: 0 8'b 0000 0001: 1 8'b 0000 0010: 2 8'b 0000 0011: 3 ... 8'b 0110 0100: 100 8'b 0110 0101: 102 8'b 0110 0110: 104 ... 8'b 1001 0110: 200 8'b 1001 0111: 204 8'b 1001 1000: 208 ... 8'b 1100 1000: 400 8'b 1100 1001: 408 8'b 1100 1010: 416 ... 8'b 1110 0010: 616 8'b 1110 0011: 632 8'b 1110 0100: 648 ... 8'b 1111 1011: 1024 8'b 1111 1100~8'b 1111 1111: Reserved

BUCK2_CTRL6 (4Dh)

The BUCK2_CTRL6 command sets buck 2's soft-shutdown delay by counting a set number of CLK pulses.

Bits	Access	Bit Name	Default	Description
7:0	R/W	BUCK2_POWER_OFF_DELAY	8'b 0000 0100	Sets buck 2's soft-shutdown delay via CLK pulses. 8'b 0000 0000: 0 8'b 0000 0001: 1 8'b 0000 0010: 2 8'b 0000 0011: 3 ... 8'b 0110 0100: 100 8'b 0110 0101: 102 8'b 0110 0110: 104 ... 8'b 1001 0110: 200 8'b 1001 0111: 204 8'b 1001 1000: 208 ... 8'b 1100 1000: 400 8'b 1100 1001: 408 8'b 1100 1010: 416 ... 8'b 1110 0010: 616 8'b 1110 0011: 632 8'b 1110 0100: 648 ... 8'b 1111 1011: 1024 8'b 1111 1100~8'b 1111 1111: Reserved

BUCK2_CTRL7 (4Eh)

The BUCK2_CTRL7 command sets the default setting for BUCK2_CTRL7 (0Ah). This command does not have direct control of converter operation.

Bits	Access	Bit Name	Default	Description
7:6	R/W	VOUT2_PG_VTH__ HIGH	2'b 00	Sets V _{OUT2} 's high-side voltage for the power good status. The hysteresis = 2.5%. 2'b 00: +7.5% from VOUT2_SETTING 2'b 01: +10% from VOUT2_SETTING 2'b 10: +12.5% from VOUT2_SETTING 2'b 11: Reserved
5	R/W	VOUT2_PG_VTH__ LOW	1'b 0	Sets V _{OUT2} 's low-side voltage threshold for the power good status. The hysteresis = 2.5%. 1'b 0: -7.5% from VOUT2_SETTING 1'b 1: -10% from VOUT2_SETTING
4	R/W	RESERVED	1'b 0	Reserved.
3:2	R/W	VOUT2_UV_VTH	2'b 00	Sets V _{OUT2} 's under-voltage (UV) status threshold. The hysteresis = 2.5%. 2'b 00: -10% from VOUT2_SETTING 2'b 01: -12.5% from VOUT2_SETTING 2'b 10: Reserved 2'b 11: Reserved
1:0	R/W	VOUT2_OV_VTH	2'b 10	Sets V _{OUT2} 's over-voltage (OV) status threshold. The hysteresis = 2.5%. 2'b 00: +8% from VOUT2_SETTING 2'b 01: +10.5% from VOUT2_SETTING 2'b 10: +13% from VOUT2_SETTING 2'b 11: Reserved

LDO_CTRL1 (4Fh)

The LDO_CTRL1 command sets the default setting for LDO_CTRL1 (0Bh). The only bits that have direct control of converter operation are LDO_SOFT_START.

Bits	Access	Bit Name	Default	Description
7	R/W	RESERVED	1'b 0	Reserved.
6:4	R/W	LDO_SOFT_START	3'b 000 (Or MODE-Determined)	Sets the LDO soft-start time after being enabled. 3'b 000: 1ms 3'b 001: 2ms 3'b 010: 4ms 3'b 011: 6ms 3'b 100: 8ms 3'b 101: 10ms 3'b 110: 12ms 3'b 111: 14ms
3:2	R/W	RESERVED	2'b 00	Reserved.
1	R/W	LDO_DISCHG	1'b 1	1'b 0: Disable LDO discharge 1'b 1: Enable LDO discharge
0	R/W	LDO_PG_VTH	1'b 1	Sets the LDO output threshold voltage for the power good status. The hysteresis = 5%. 1'b 0: -10% from LDO_SETTING 1'b 1: -15% from LDO_SETTING

LDO_CTRL2 (50h)

The LDO_CTRL2 command sets the default setting for LDO_CTRL2 (0Ch). This command does not have direct control of converter operation.

Bits	Access	Bit Name	Default	Description
7	R/W	RESERVED	1'b 0	Reserved.
6:0	R/W	LDO_SETTING	7'b 011 1100 (Or MODE-Determined)	Sets the LDO's output voltage. 30mV per LSB from 0.6V to 3.6V. All lower settings: Reserved 7'b001 0100: 600mV 7'b001 0101: 630mV ... 7'b111 1000: 3600mV All higher settings: Reserved

LDO_CTRL3 (51h)

The LDO_CTRL3 command sets the LDO's soft-start delay by counting a set number of CLK pulses.

Bits	Access	Bit Name	Default	Description
7:0	R/W	LDO_POWER_ON_DELAY	8'b 0000 0000 (Or MODE-Determined)	Sets the LDO's soft-start delay via CLK pulses. 8'b 0000 0000: 0 8'b 0000 0001: 1 8'b 0000 0010: 2 8'b 0000 0011: 3 ... 8'b 0110 0100: 100 8'b 0110 0101: 102 8'b 0110 0110: 104 ... 8'b 1001 0110: 200 8'b 1001 0111: 204 8'b 1001 1000: 208 ... 8'b 1100 1000: 400 8'b 1100 1001: 408 8'b 1100 1010: 416 ... 8'b 1110 0010: 616 8'b 1110 0011: 632 8'b 1110 0100: 648 ... 8'b 1111 1011: 1024 8'b 1111 1100~8'b 1111 1111: Reserved

LDO_CTRL4 (52h)

The LDO_CTRL4 command sets the LDO's soft-shutdown delay by counting a set number of CLK pulses.

Bits	Access	Bit Name	Default	Description
7:0	R/W	LDO_POWER_OFFDELAY	8'b 0000 0100	Sets the LDO's soft-shutdown delay via CLK pulses. 8'b 0000 0000: 0 8'b 0000 0001: 1 8'b 0000 0010: 2 8'b 0000 0011: 3 ... 8'b 0110 0100: 100 8'b 0110 0101: 102 8'b 0110 0110: 104 ... 8'b 1001 0110: 200 8'b 1001 0111: 204 8'b 1001 1000: 208 ... 8'b 1100 1000: 400 8'b 1100 1001: 408 8'b 1100 1010: 416 ... 8'b 1110 0010: 616 8'b 1110 0011: 632 8'b 1110 0100: 648 ... 8'b 1111 1011: 1024 8'b 1111 1100~8'b 1111 1111: Reserved

SYS_CTRL1 (53h)

The SYS_CTRL1 command sets the default setting for SYS_CTRL1 (0Dh). This command does not have direct control of converter operation.

Bits	Access	Bit Name	Default	Description
7	R/W	PMIC_EN	1'b1	1'b 0: Buck 1, buck 2, and the LDO are all disabled 1'b 1: Buck 1, buck 2, and the LDO are all enabled (must enable each regulator)
6	R/W	VOUT1_EN	1'b1	1'b 0: Disable buck 1 1'b 1: Enable buck 1
5	R/W	VOUT2_EN	1'b1	1'b 0: Disable buck 2 1'b 1: Enable buck 2
4	R/W	LDO_EN	1'b0	1'b 0: Disable LDO 1'b 1: Enable LDO
3:2	R/W	RESERVED	2'b00	Reserved.
1:0	R/W	GPIO_CTRL	2'b11	GPIO open-drain output or analog input control 2'b 00: The GPIO output is low 2'b 01: Reserved 2'b 10: GPIO is part of flex-time control and used as the external converter's enable signal. GPIO outputs as an EN signal for the external converter and its on/off sequence can be configured via the 0x57 and 0x58 registers 2'b 11: The GPIO output is floating/high

SYS_CTRL2 (54h)

The SYS_CTRL2 command sets buck 1 and buck 2's operation mode.

Bits	Access	Bit Name	Default	Description
7	R/W	SINGLE/DUAL	1'b 1 (Or MODE-Determined)	Sets whether buck 1 and buck 2 operate in single-phase, dual-output mode or dual-phase, single-output output. 1'b 0: Single-phase, dual-output 1'b 1: Dual-phase, single-output
6:0	R/W	RESERVED	7'b 000 0000	Reserved.

SYS_CTRL3(55h) The SYS_CTRL3 command sets the default settings for SYS_CTRL3 (0Eh). The only bit that has direct control of converter operation is PROTECT_MODE.

Bits	Access	Bit Name	Default	Description
7:5	R/W	VIN_PG_VTH	3'b 110	Sets the V _{IN} rising threshold for the VIN_PG bit. The hysteresis = 0.5V. 3'b 000: 9.5V (same as 3'b 001) 3'b 001: 9.5 V 3'b 010: 8.5V 3'b 011: 7.5V 3'b 100: 6.5V 3'b 101: 5.5V 3'b 110: 4.25V 3'b 111: Reserved
4	R/W	MASK_PG	1'b 0	Masks the PG pin's output. 1'b 0: No mask 1'b 1: Masked
3	R/W	PG_DELAY_EN	1'b 0	1'b 0: No delay on PG 1'b 1: There is a 100μs delay on PG
2	R/W	VIN_OVP_EN	1'b 1	1'b 0: Enable V _{IN} over-voltage protection (OVP) 1'b 1: Disable V _{IN} OVP
1	R/W	RESERVED	1'b 0	Reserved.
0	R/W	PROTECT_MODE	1'b 1	Sets the protection mode for the buck converters. 1'b 0: Latch-off mode 1'b 1: Hiccup mode

SYS_CTRL4 (56h)

The SYS_CTRL4 command has direct control of the converter operation.

Bits	Access	Bit Name	Default	Description
7:5	R/W	OT_TH	3'b 010	Sets the converter's temperature shutdown threshold. The hysteresis = 20°C. 3'b 000: 125°C 3'b 001: 135°C 3'b 010: 145°C 3'b 011: 155°C 3'b 100: 165°C 3'b 101: Reserved 3'b 110: Reserved 3'b 111: Reserved

4:2	R/W	OTW_TH	3'b 011	Sets the over-temperature (OT) warning threshold. The hysteresis = 20°C. 3'b 000: Reserved 3'b 001: 100°C 3'b 010: 110°C 3'b 011: 120°C 3'b 100: 130°C 3'b 101: 140°C 3'b 110: 150°C 3'b 111: Reserved
1:0	R/W	VIN_UV_SEL	2'b 00	Sets the buck V_{IN} under-voltage lockout (UVLO) rising threshold. 2'b 00: The default value in the Electrical Characteristics section starting on page 6 2'b 01: 2.9V 2'b 10: 4V 2'b 11: 6V

GPIO_CONFIG (57h)

The GPIO_CONFIG command controls converter operation (GPIO) directly.

Bits	Access	Bit Name	Default	Description
7:0	R/W	GPIO_POWER_ON_DELAY	8'b 0000 0000 (Or MODE-Determined)	If GPIO_CTL = 10, GPIO goes high when counting this number of CLK pulses. 8'b 0000 0000: 0 8'b 0000 0001: 1 8'b 0000 0010: 2 8'b 0000 0011: 3 ... 8'b 0110 0100: 100 8'b 0110 0101: 102 8'b 0110 0110: 104 ... 8'b 1001 0110: 200 8'b 1001 0111: 204 8'b 1001 1000: 208 ... 8'b 1100 1000: 400 8'b 1100 1001: 408 8'b 1100 1010: 416 ... 8'b 1110 0010: 616 8'b 1110 0011: 632 8'b 1110 0100: 648 ... 8'b 1111 1011: 1024 8'b 1111 1100~8'b 1111 1111: Reserved

GPIO_CONFIG (58h)

The GPIO_CONFIG command controls converter operation (GPIO) directly.

Bits	Access	Bit Name	Default	Description
7:0	R/W	GPIO_POWER_OFF_DELAY	8'b 0000 0000 (Or MODE-Determined)	If GPIO_CTL = 10, GPIO goes low when counting this number of CLK pulses. 8'b 0000 0000: 0 8'b 0000 0001: 1 8'b 0000 0010: 2 8'b 0000 0011: 3 ... 8'b 0110 0100: 100 8'b 0110 0101: 102 8'b 0110 0110: 104 ... 8'b 1001 0110: 200 8'b 1001 0111: 204 8'b 1001 1000: 208 ... 8'b 1100 1000: 400 8'b 1100 1001: 408 8'b 1100 1010: 416 ... 8'b 1110 0010: 616 8'b 1110 0011: 632 8'b 1110 0100: 648 ... 8'b 1111 1011: 1024 8'b 1111 1100~8'b1111 1111: Reserved

ADC_CTRL2 (59h)

The ADC_CTRL2 command enables/disables the ADC and sets the sample frequency.

Bits	Access	Bit Name	Default	Description
7	R/W	ADC_EN	1'b 1	1'b 0: Disable the ADC 1'b 1: Enable the ADC
6:2	RW	RESERVED	5'b 00000	Reserved.
1:0	R/W	ADC_SAMPLE_FREQ	2'b 01	Sets the frequency to refresh all the ADC channels. 2'b 00: 4kHz 2'b 01: 2kHz 2'b 10: 1kHz 2'b 11: 0.5kHz

MASK1 (5Ah)

The MASK1 command sets the default setting for MASK1 (1Bh). This command does not have direct control of converter operation. The MASK1 command masks the INT pin's behavior. The STATUS register still indicates each event.

Bits	Access	Bit Name	Default	Description
7	R/W	VIN_PG_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
6	R/W	VOUT1_PG_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
5	R/W	VOUT2_PG_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask

4	R/W	LDO_PG_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
3:2	R/W	RESERVED	2'b 00	Reserved.
1	R/W	OTW_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
0	R/W	OT_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask

MASK2 (5Bh)

The MASK2 command sets the default setting for MASK2 (1Ch). This command does not have direct control of converter operation. The MASK2 command masks the INT pin's behavior. The STATUS register still indicates each event.

Bits	Access	Bit Name	Default	Description
7	R/W	VIN_OV_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
6	R/W	VIN_UV_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
5	R/W	VOUT1_OV_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
4	R/W	VOUT2_OV_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
3	R/W	VOUT1_UV_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
2	R/W	VOUT2_UV_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
1	R/W	VOUT1_OC_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask
0	R/W	VOUT2_OC_MSK	1'b 0	1'b 0: Do not mask 1'b 1: Mask

AVP_CTRL1 (5Ch)

L1 (5Ch)

The AVP_CTRL1 command sets the default setting for AVP_CTRL1 (1Fh). This command does not have direct control of converter operation.

Bits	Access	Bit Name	Default	Description
7	R/W	AVP1_EN	1'b 0	Enables buck 1's AVP function. 1'b 0: Disable the AVP function 1'b 1: Enable the AVP function
6:5	R/W	AVP1_GAIN	2'b 00	Set the AVP gain. 1'b 00: 3mV/A 1'b 01: 5.5mV/A 1'b 10: Reserved 1'b 11: Reserved

4:0	R/W	AVP1_OFFSET	5'b 00000	Sets the DC offset voltage for the output voltage command value when AVP is enabled. This offset ranges between -30mV and +30mV. 2mV per step. 5'b x0000: 0mV 5'b 00001: +2mV ... 5'b 01111: +30mV 5'b 10001: -2mV ... 5'b 11111: -30mV
-----	-----	-------------	-----------	--

AVP_CTRL1 (5Dh)

The AVP_CTRL1 sets the default setting for AVP_CTRL2 (20h). This command does not have direct control of converter operation.

Bits	Access	Bit Name	Default	Description
7	R/W	AVP2_EN	1'b 0	Enables buck 2's AVP function. 1'b 0: Disabled 1'b 1: Enabled
6:5	R/W	AVP2_GAIN	2'b 00	Sets the AVP gain. 2'b 00: 2.6mV/A 2'b 01: 5.7mV/A 2'b 10: 8.6mV/A 2'b 11: 11.3mV/A
4:0	R/W	AVP2_OFFSET	5'b 00000	Sets the DC offset voltage for the output voltage command value when AVP is enabled. This offset ranges between -30mV and +30mV. 2mV per step. 5'b x0000: 0mV 5'b 00001: +2mV ... 5'b 01111: +30mV 5'b 10001: -2mV ... 5'b 11111: -30mV

CLK_CTRL1 (5Eh)

The CLK_CTRL1 command has direct control over converter operation.

Bits	Access	Bit Name	Default	Description
7	R/W	CLK_MODE	1'b 1 (Or MODE-Determined)	Sets the initiator/target configuration for the power sequence. 1'b 0: Target PMIC 1'b 1: Initiator PMIC
6:4	R/W	CLK_FREQUENCY	3'b 100	Configures the CLK pin's clock frequency. 3'b 000: 100Hz 3'b 001: 200Hz 3'b 010: 500Hz 3'b 011: 1kHz 3'b 100: 2kHz 3'b 101: 5kHz 3'b 110: 10kHz 3'b 111: 20kHz

3:1	R/W	CLK_NUMBER	3'b 001	Configures the CLK pin's maximum clock output number. If the PG pin is pulled up, and the maximum POWER_ON_DELAY or maximum POWER_ON_DELAY CLK number of the enabled power rails is less than CLK_NUMBER, CLK outputs CLK_NUMBER clocks during turning EN on/off. If the on/off delay CLK number exceeds CLK_NUMBER, CLK continues outputting clocks until the on/off sequence is complete. If the PG pin is pulled down or floating, CLK does not stop outputting clocks until the EN turns off or $V_{IN} < UVLO$. Enable or disable the power channel via the I²C; CLK stays high. 3'b 000: 8 3'b 001: 16 3'b 010: 32 3'b 011: 64 3'b 100: 128 3'b 101: 256 3'b 110: 512 3'b 111: 1024
0	R/W	RESERVED	1'b 0	Reserved.

CLK_CTRL2 (5Fh)

Direct control on Converter operation.

Bits	Access	Bit Name	Default	Description
7:3	R/W	RV	5'b 00000	Reserved.
2	R/W	CLK_PAUSE_EN	1'b 0	Enables the pausing feature of the CLK clock's output. 1'b 0: Disabled. The PMIC does not pull the CLK pin low during soft start/soft shutdown 1'b 1: Enabled. The PMIC pulls the CLK pin low during soft start/stop
1	R/W	CLK_ON_ERROR_PAUSE_EN	1'b 0	Enables the pausing feature if an error occurs during soft start. 1'b 0: Disabled. The PMIC does not pull the CLK pin low if an error occurs during soft start 1'b 1: Enabled. The PMIC pulls the CLK pin low if an error occurs during soft start
0	R/W	RESERVED	1'b 0	Reserved.

I2C_CONFIG (60h)

The I2C_CONFIG command enables MODE control and sets the I²C address.

Bits	Access	Bit Name	Default	Description
7	R/W	MODE_EN	1'b1	Enables MODE control. 1'b 0: MODE is disabled. The MODE-determined MTP registers keep the original value as the default value 1'b 1: MODE is enabled. The MODE-determined MTP registers load the default value based on MODE selection
6:0	R/W	I2C_ADDRESS	7'b 000 0000	Sets the I ² C 7-bit address.

MTP_CTRL1 (61h)

The MTP_CTRL1 command has direct control over converter operation.

Bits	Access	Bit Name	Default	Description
7:0	WO	MTP_PASSWORD	-	Sets the password for MTP configuration. The password is 0xC8.

MTP_CTRL1 (62h)

The MTP_CTRL1 command controls MTP configurations.

Bits	Access	Bit Name	Default	Description
7:2	R/W	RESERVED	6'b 000000	Reserved.
1	R/W	MTP_RESTORE	1'b 0	Restores MTP control. Write 1 to this bit to restore all register values to the MTP registers' values.
0	R/W	MTP_PROGRAM	1'b 0	Controls MTP configuration. Write 1 to this bit to start MTP configuration. Write 0xC8 to MTP_CTRL1 (61h) before configuration.

ID2 (64h)

The ID2 command has direct control over converter operation.

Bits	Access	Bit Name	Default	Description
7:0	R/W	MTP_CODE	8'b 0000 0000	Sets the MTP suffix code. MPS defines this register.

MODE REGION REGISTERS

When MODE_EN = 1, some of the MTP region registers load their default values from the MODE region registers, depending on the MODE pin's resistance.

For the following register settings, their configurations are copied from the corresponding registers in 0x70~0xC7. There are 8 sets of configuration settings listed in MODE0~MODE7 for each of the following bits (see Table 6). The MODE resistor determines which mode is selected.

Table 6: Registers Selected According to MODE0~MODE7

Command Code (0X)	Command Name	Tape	D7	D6	D5	D4	D3	D2	D1	D0
41	BUCK1_CTRL1	R/W		VOUT1_SOFT_START						
42	BUCK1_CTRL2	R/W			BUCK1_FSW			VOUT1_SETTING_LOW

60	I2C_CONFIG	R/W		I2C_ADDRESS						

MODE REGION REGISTER DESCRIPTION

Bit Name ⁽¹¹⁾	Description
MODEx_VOUT1_SETTING	Sets the default value for VOUT1_SETTING_HIGH (BUCK1_CTRL3 (43h), bits D[7:0]) and VOUT1_SETTING_LOW (BUCK1_CTRL2 (42h), bits[2:0]).
MODEx_VOUT2_SETTING	Sets the default value for VOUT2_SETTING_HIGH (BUCK2_CTRL3 (4Ah), bits[7:0]) and VOUT2_SETTING_LOW (BUCK2_CTRL2 (49h), bits[2:0]).
MODEx_BUCK1_FB_HALF	Sets the default value for BUCK1_FB_HALF (BUCK1_CTRL4 (44h), bit[5]).
MODEx_BUCK2_FB_HALF	Sets the default value for BUCK2_FB_HALF (BUCK2_CTRL4 (4Bh), bit[5]).
MODEx_BUCK1_FSW	Sets the default value for BUCK1_FSW (BUCK1_CTRL2 (42h), bits[5:4]).
MODEx_BUCK2_FSW	Sets the default value for BUCK2_FSW (BUCK2_CTRL2 (49h), bits[5:4]).
MODEx_CLK_MODE	Sets the default value for CLK_MODE (CLK_CTRL1 (5Eh), bit[7]).
MODEx_SINGLE/DUAL	Sets the default value for SINGLE/DUAL (SYS_CTRL2 (54h), bit[7]).
MODEx_BUCK1_POWER_ON_DELAY	Sets the default value for BUCK1_POWER_ON_DELAY (BUCK1_CTRL5 (45h), bits[7:0]).
MODEx_BUCK2_POWER_ON_DELAY	Sets the default value for BUCK2_POWER_ON_DELAY (BUCK2_CTRL5 (4Ch), bits[7:0]).
MODEx_VOUT1_SOFT_START_TIME	Sets the default value for VOUT1_SOFT_START (BUCK1_CTRL1 (41h), bits[6:4]).
MODEx_VOUT2_SOFT_START_TIME	Sets the default value for VOUT2_SOFT_START (BUCK2_CTRL1 (48h), bits[6:4]).
MODEx_LDO_EN	Sets the default value for LDO_EN (SYS_CTRL1 (53h), bit[4]).
MODEx_LDO_SOFT_START_TIME	Sets the default value for LDO_SOFT_START (LDO_CTRL1 (4Fh), bits[6:4]).
MODEx_I2C_ADDRESS	Sets the default value for the last three digits of I2C_ADDRESS (I2C_CONFIG (60h), bits[2:0]).
MODEx_GPIO_CTRL	Sets the default value for GPIO_CTRL (SYS_CTRL1 (53h), bits[1:0]).
MODEx_LDO_SETTING	Sets the default value for LDO_SETTING (LDO_CTRL2 (50h), bits[6:0]).
MODEx_LDO_POWER_ON_DELAY	Sets the default value for LDO_POWER_ON_DELAY (LDO_CTRL3 (51h), bits[7:0]).
MODEx_GPIO_POWER_ON_DELAY	Sets the default value for GPIO_POWER_ON_DELAY (GPIO_CONFIG (57h), bits[7:0]).

Note:

11) MODEx represents MODE0–MODE7.

APPLICATION INFORMATION

Setting the Output Voltage

When using an external resistor divider, set VOUT_x_SETTING to a proper value and BUCK_x_FB_HALF = 0. The feedback resistance (R_{FB1}) cannot be too large or too small considering the tradeoff for stability and dynamics. There is no strict requirement for the feedback resistor. R_{FB2} can be estimated with Equation (2):

$$R_{FB2} = \frac{R_{FB1}}{\frac{V_{OUT}}{V_{FB}} - 1} \quad (2)$$

V_{FB} is generated by the internal DAC, which can be adjusted from 0.3V to 1.8V. For example, if V_{FB} = 0.6V, choose the recommended resistor value. Table 7 shows the common output voltages for the resistor divider.

Table 7: Resistor Values for Common Output Voltages

V _{OUT} (V)	R1 (kΩ)	R2 (kΩ)
1.0	10 (1%)	15 (1%)
1.2	10 (1%)	10 (1%)
1.8	10 (1%)	5 (1%)

When using the internal resistor divider, remove R_{FB2} and use R_{FB1} = 0Ω. The maximum V_{OUT} can only be set to 1.8V.

Selecting the Input Capacitor

The step-down converter has a discontinuous input current, and requires a capacitor to supply the AC current to the converter while maintaining the DC input voltage. Use low-ESR capacitors for the best performance. Use ceramic capacitors with X5R or X7R dielectrics for the best results due to their low ESR and small temperature coefficients. For most applications, use a 22μF capacitor.

Since the input capacitor (C1) absorbs the input switching current, it requires an adequate ripple current rating. The input capacitor's RMS current can be calculated with Equation (3):

$$I_{C1} = I_{LOAD} \times \sqrt{\frac{V_{OUT}}{V_{IN}} \times \left(1 - \frac{V_{OUT}}{V_{IN}}\right)} \quad (3)$$

The worst-case condition occurs at V_{IN} = 2 × V_{OUT}, estimated with Equation (4):

$$I_{C1} = \frac{I_{LOAD}}{2} \quad (4)$$

For simplification, choose an input capacitor with an RMS current rating greater than half of the maximum load current.

The input capacitor can be electrolytic, tantalum, or ceramic. When using electrolytic or tantalum capacitors, add a small, high-quality ceramic capacitor (e.g. 0.1μF) placed as close to the IC as possible. When using ceramic capacitors, ensure that they have enough capacitance to provide sufficient charge to prevent excessive voltage ripple at input. The input voltage ripple caused by the capacitance can be calculated with Equation (5):

$$\Delta V_{IN} = \frac{I_{LOAD}}{f_{SW} \times C1} \times \frac{V_{OUT}}{V_{IN}} \times \left(1 - \frac{V_{OUT}}{V_{IN}}\right) \quad (5)$$

Selecting the Step-Down Regulator's Output Capacitor

The step-down regulator's output capacitor maintains the DC output voltage. Use ceramic, tantalum, or low-ESR electrolytic capacitors. For the best results, use low-ESR capacitors to keep the output voltage ripple low.

The output voltage ripple can be estimated with Equation (6):

$$\Delta V_{OUT} = \frac{V_{OUT}}{f_{SW} \times L_1} \times \left(1 - \frac{V_{OUT}}{V_{IN}}\right) \times \left(R_{ESR} + \frac{1}{8 \times f_{SW} \times C2}\right) \quad (6)$$

Where L₁ is the inductance and R_{ESR} is the output capacitor's equivalent series resistance (ESR).

For ceramic capacitors, the capacitance dominates the impedance at the switching frequency and causes the majority of the output voltage ripple. For simplification, the output voltage ripple can be calculated with Equation (7):

$$\Delta V_{OUT} = \frac{V_{OUT}}{8 \times f_{SW}^2 \times L_1 \times C2} \times \left(1 - \frac{V_{OUT}}{V_{IN}}\right) \quad (7)$$

For tantalum or electrolytic capacitors, the ESR dominates the impedance at the switching

frequency. For simplification, the output voltage ripple can be estimated with Equation (8):

$$\Delta V_{OUT} = \frac{V_{OUT}}{f_{SW} \times L_1} \times \left(1 - \frac{V_{OUT}}{V_{IN}}\right) \times R_{ESR} \quad (8)$$

The characteristics of the output capacitor also affect the regulation stability.

PCB Layout Guidelines

Efficient layout of the switching power supplies is critical for stable operation, especially for the high switching frequency converter. If the layout is not carefully considered, the regulator could show poor line or load regulation, as well as stability issues. It is recommended to use a 4-layer PCB for thermal improvement. For the best results, refer to Figure 15 and follow the guidelines below:

1. Place the input capacitor and output capacitor close to VIN1/2, VOUT1/2, and GND.
2. Place the ceramic capacitor, especially the small package size (0402) bypass capacitor as close to the VIN1/2 and GND pins as possible to minimize high-frequency noise.
3. Place the VCC decoupling capacitor close to VCC and AGND.

4. Place the FB resistor divider as close as possible to the FB1P, FB1N, FB2P, and FB2N pins.
5. Avoid routing sensitive traces close to the input plane and SW node.
6. Connect the FB1P, FB1N, FB2P, and FB2N pins to VOUT1/2 and AGND via a Kelvin connection.
