

DESCRIPTION

The MP28300 is a monolithic power management unit containing 300mA high efficiency step-down switching converters and a 100mA LDO regulator. The sub micro-ampere quiescent current provides extremely high efficiency when load current is low down to uA range. With the input range up to 5.5V, the MP28300 is ideal for powering battery-powered devices.

The constant-on-time control scheme provides fast transient response, high light load efficiency as well as the minimum capacitors. The regulation is tight by integrating an error amplifier to correct the output voltage.

Another 100mA LDO regulator provides easy system configuration with clean output voltage.

The CTRL pins control the ON/OFF and output voltage selection function.

The MP28300 requires a minimum number of readily available standard external components and is available in a small QFN12 (2x2mm) package.

ELECTRICAL SPECIFICATION

Parameter	Symbol	Value	Units
Input Voltage	V_{IN1}, V_{IN2}	2.0 – 5.5	V
Output Voltage	V_{OUT1}, V_{OUT2}	Table 1	
Output Current	I_{OUT1}	0.3	A
	I_{OUT2}	0.1	A

Note: $V_{IN} < 3.3V$ may need more input capacitor.

FEATURES

300mA Buck Switcher:

- Ultra Low IQ: 500nA
- Wide 2.0V to 5.5V Operating Input Range
- 7 Selectable Output Voltages
- Up to 300mA Output Current
- 1.5MHz Switching Frequency at CCM Mode
- 100% Duty Cycle in Dropout
- 0.25Ω and 0.25Ω Internal Power MOSFET Switches
- Cycle-by-Cycle Over Current Protection
- Short Circuit Protect with Hiccup Mode

100mA LDO:

- Ultra Low IQ: 300nA
- 2.0V to 5.5V Operation Input Range
- 3 Selectable Output Voltage
- Over Temperature Protection
- Available in a QFN12-2.0mmx2.0mm Package

APPLICATIONS

- Solid-State Drive
- Portable Instruments
- Battery-Powered Devices

QUICK START GUIDE

The output voltage of this board is set by Table1. When switcher turns to high, relative CTRL pin connects to Vin; when switcher turns to low, CTRL pin connects to GND.

1. Connect the positive and negative terminals of the load to the VOUT and GND pins, respectively.
2. Preset the power supply output between 2.0V and 5.5V, and then turn off the power supply.
3. Connect the positive and negative terminals of the power supply output to the VIN and GND pins, respectively. Ton on the power supply.
4. According to Table1, turn on relative switchers(CTRL) to test voltage. The board will automatically start up.
5. Swith to different ouput voltage only need move relative switcher directly.

Table 1 CTRL vs. Output Voltages

For Step Down Switcher:			
CTRL3	CTRL2	CTRL1	OUT1
0	0	0	Disabled
0	0	1	0.8V
0	1	0	1.0V
0	1	1	1.2V
1	0	0	1.5V
1	0	1	1.8V
1	1	0	2.5V
1	1	1	3.3V
For LDO:			
CTRL5	CTRL4		OUT2
0	0		Disabled
0	1		1.3V
1	0		1.8V
1	1		3.3V

Note: If only use LDO, Vin1 should keep more than 2V.
