

The Future of Analog IC Technology®

# EV3900DK-00F

## High Efficiency Boost Controller EV Board

### DESCRIPTION

The EV3900DK-00F is an evaluation board for the MP3900DK. It is configured to provide a regulated 25V output at up to 2A load current from a 12V input. The output is adjustable by changing feedback resistors on the evaluation board. MOSFET  $R_{ds,on}$  can be directly used for current sense purpose without an external sense resistor.

Although the demo board uses the external 20mΩ to sense the current, it also provides the stuffing option for users who want to use the  $R_{DS(ON)}$  as the sense element.

### ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input voltage	$V_{IN}$	10~20	V
Input current	$I_{IN}$	0~6	A
Output voltage	$V_O$	25	V
Output Current	$I_o$	2	A

### FEATURES

- Current Mode Control
- Undervoltage Lockout
- Cycle-by-Cycle Current Limiting
- Lossless Current Sense ( $V_{ISENSE} < 30V$ )
- 10μA Shutdown Current
- 180μA Quiescent Current
- 330KHz Constant Frequency Operation

### APPLICATIONS

- TV CCFL Power Generation
- Telecom Isolated Power
- Brick Modules

"MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

### EV3900DK-00F EVALUATION BOARD

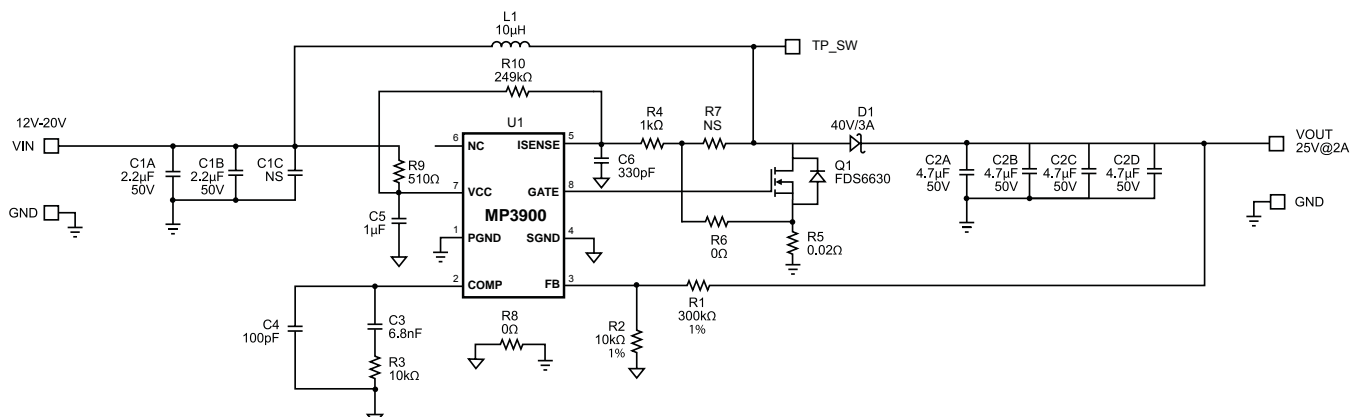

(L x W x H) 1.8" x 1.8" x 0.4"  
4.6cm x 4.6cm x 1.0cm

Board Number	MPS IC Number
EV3900DK-00F	MP3900DK

### Efficiency vs. Output Current

## EVALUATION BOARD SCHEMATIC

## EV3900DK-00F BILL OF MATERIALS

Qty	Ref	Value	Description	Package	Manufacturer	Manufacturer P/N
2	C1A, C1B	2.2uF	Ceramic Cap., 50V, X7R	1210	TDK	C3225X7R1H225K

## QUICK START GUIDE

1. The output voltage of this board is set to 25V. The board layout accommodates most commonly used inductors and output capacitors.
2. Preset Power Supply to  $10V \leq V_{IN} \leq 20V$ .
3. Turn Power Supply off.
4. Connect the power supply terminals to:  
Positive (+): VIN  
Negative (-): GND  
Connect the load to:  
Positive (+): VOUT  
Negative (-): GND  
Load current is up to 2A.
5. Turn on the power supply after making connections.
6. The MP3900 is enabled automatically on the evaluation board once VIN is applied. To disable the MP3900, just turn off the power supply or pull COMP low.
7. The output voltage VOUT can be changed by varying R1. Calculate the new value using the formula:

$$R1 = (V_{OUT}/V_{FB} - 1) \times R2$$

Where  $V_{FB} = 0.8V$  and  $R2 = 10k\Omega$

For example, for  $V_{OUT} = 25V$

$$R1 = (25V/0.8V - 1) \times 10k\Omega = 302.5k\Omega$$

Therefore use a 300k $\Omega$  standard 1% value.

8. If MOSFET  $R_{DS(ON)}$  sense is preferred, remove R6 and put R7 with 0 $\Omega$ .
