EV4088-N-00A

198VAC~265VAC/50Hz, 60V/135mA
Low Cost, Small form Factor, High PFC
Off-line Dimmable LED Driver Evaluation Board

DESCRIPTION

The EV4088-N-00A Evaluation Board is designed to demonstrate the capabilities of MP4088. The MP4088 is a highly integrated TRIAC dimmable LED driver with high power factor. It is specifically designed for high-line input (230VAC), no-isolated, TRIAC-dimmable LED lighting applications, especially for the low cost and small form factor applications.

The MP4088 integrates a 500V MOSFET. Only a single winding inductor is required to realize the solution. It features MPS's proprietary hybrid operation mode which is designed to achieve good dimming performance.

The EV4088-N-00A is typically designed for driving an 8.1W TRIAC dimmable LED bulb with $60V_{TYP}$, 135mA LED load from 198VAC to 265VAC, 50Hz.

The EV4088-N-00A has an excellent efficiency and meets IEC61547 surge immunity, IEC61000-3-2 Class C harmonics and EN55015 conducted EMI requirements. It has multi-protection function as over-voltage protection; output short-circuit protection, thermal shut down, etc.

ELECTRICAL SPECIFICATION

Parameter	Symbol	Value	Units
Input Voltage	V_{IN}	198 to 265	VAC
Output Voltage	V_{OUT}	60	V
LED Current	I_{LED}	135	mA
Output Power	P_{OUT}	8.1	W
Efficiency (full load)	η	>82	%
Power Factor	PF	>0.76	
THD	THD	<50.3	%

FEATURES

- Excellent TRIAC Dimming Performance
- Lowest Cost BOM
- Constant Current LED Driver
- Good LED Current Accuracy
- 500V MOSFET Integrated
- Internal HV Fast Start-Up
- Single Winding Inductor
- High Power Factor(>0.76)
- LED Current Foldback at High Temperature
- Thermal Shutdown (Auto Restart with Hysteresis)
- VCC Under Voltage Lockout with Hysteresis (UVLO)
- Programmable Over Voltage Protection
- Output Short Circuit Protection
- Fit inside GU10 Bulb Enclosure

APPLICATIONS

- Solid State Lighting
- Industrial & Commercial Lighting
- Residential Lighting

Warning: Although this board is designed to satisfy safety requirements, the engineering prototype has not been agency approved. Therefore, all testing should be performed using an isolation transformer to provide the AC input to the prototype board.

CIRCUIT DESCRIPTION

The EV4088-N-00A is configured in a single-stage Buck-boost topology and gets a cost effective BOM. It also achieves high power factor and excellent TRIAC dimming performance.

R1, R2, and BD1 compose the input stage. The resistors R1, R2 are used as a passive damper of dimming. The diode rectifier BD1 rectifies the input line voltage.

L1, L2, R3, R4, C1 and C2 form a π EMI filter.

R5, C3, and D2 form a RCD snubber to obtain good surge test performance, the surge spike energy will be absorbed by the electrolytic cap C3.

R7, C4 are used as a bleeder which keeping the TRIAC current above the minimum holding current after leading edge dimmer turns on.

C5 is used to supply the power for MP4088. The power is charged by the internal high voltage regulator from HV pin.

R8 and R9 are used to monitor the output OVP condition. The OVP voltage is set by the divider ratio of R8 and R9.

R10 is sensing resistor for LED current control. The value of R10 sets the output LED current.

Diode D1 is the Buck-boost fly-wheel diode, the inductor L3 and the capacitor C6 are the output filter. The resistor R6 is placed as a dummy load to consume the output power in open load condition. The diode D3 is used to prevent the output current flowing back to IC when input Sine voltage drops lower than output voltage.

Electric Strength Test

Input and output was shorted respectively. 3750VAC/50Hz sine wave applied between input and output for 1min, and operation was verified.

Surge Test

Line to Line 500V surge testing was completed according to IEC61547.
Input voltage was set at 230VAC/50Hz. Output was loaded at full load and operation was verified following each surge event.

Surge Level (V)	Input Voltage (VAC)	Injection Location	Injection Phase (°)	Test Result (Pass/Fail)
500	230	L to N	90	Pass
-500	230	L to N	270	Pass

Thermal Test

Test without dimmer and with dimmer

QUICK START GUIDE

1. Preset AC Power Supply to 198VAC ≤ V_{IN} ≤265VAC.
2. Turn Power Supply off.
3. Connect the LED string between “LED+” (anode of LED string) and “LED-” (cathode of LED string).
4. Connect Power Supply terminals to AC V_{IN} terminals (“L” and “N”) as shown on the board.
5. Turn AC Power Supply on after making connections.
