EV4350DQ-00A

2.5A, 4MHz, 36V Step-Down Converter

EVALUATION BOARD

DESCRIPTION

The EV4350DQ-00A is an evaluation board for the MP4350, a high frequency step-down switching regulator with an integrated internal high-side high voltage power MOSFET. The IC provides 2.5A output with current mode control for fast loop response and easy compensation.

High power conversion efficiency over a wide load range is achieved by scaling down the switching frequency at light load condition to reduce the switching and gate driving losses.

The frequency foldback helps prevent inductor current runaway during startup and thermal shutdown provides reliable, fault tolerant operation.

By switching at 4MHz, the MP4350 prevents EMI (Electromagnetic Interference) noise problems, such as those found in AM radio and ADSL applications.

FEATURES

- Wide 4.5V to 36V Operating Input Range
- Up to 4MHz Programmable Switching Frequency
- Precision Current Limit without a Current Sensing Resistor
- Up to 95% Efficiency
- Fully Assembled and Tested

APPLICATIONS

- High Voltage Power Conversion
- Automotive Systems
- Industrial Power Systems
- Distributed Power Systems
- Battery Powered Systems

"MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	V _{IN}	4.5 – 36	V
Output Voltage	V _{OUT}	3.3	V
Output Current	I _{OUT}	2.5	A

EV4350DQ-00A EVALUATION BOARD

(L x W x H) 1.8" x 1.8" x 0.4"
4.6cm x 4.6cm x 1.0cm

Board Number	MPS IC Number
EV4350DQ-00A	MP4350DQ

EVALUATION BOARD SCHEMATIC

QUICK START GUIDE

1. Connect the positive and negative terminals of the load to the VOUT and GND pins, respectively.
2. Preset the power supply output to 12V and turn off the power supply.
3. Connect the positive and negative terminals of the power supply output to the VIN and GND pins, respectively.
4. Turn on the power supply. The EV4350DQ-00A will automatically start up.
5. To use the Enable function, apply a digital input the EN pin. Drive EN higher than 1.6V to turn on the regulator or less than 1.2V to turn it off.
6. An input under-voltage lockout (UVLO) function is implemented by the addition of a resistor divider (R1 and R2). The EN threshold is 1.2V (falling edge), so the input UVLO threshold is:

$$UVLO = 1.2V \times \left(1 + \frac{R2}{R1}\right)$$

The UVLO threshold is preset to 6V on this board.

7. To change the switching frequency, adjust the value of R3:

$$f_s(\text{KHz}) = \frac{70000}{\text{POWER}(R3(\text{k}\Omega), 0.93)}$$

The switching frequency on the board is preset to 500KHz.

Please note that an external bootstrap diode from a 5V supply to the BST pin is necessary to boost gate drive voltage if the switching frequency is above 2MHz. This is because the charge time is reduced at such high switching frequencies.

8. To adjust the output voltage, change the values of R4 and R6, $V_{FB}=0.8V$. For $R2=40.2k\Omega$, change R1 using the equation:

$$R1 = 50.25 \times (V_{OUT} - 0.8) \text{ (k}\Omega\text{)}$$

Please follow the application information on the MP4350 datasheet to recalculate/select compensation values, the inductor value and the output capacitor if the output voltage needs to be reprogrammed.
