

## DESCRIPTION

The EV4569-N-00A is an evaluation board for the MP/MQ4569GN, a step-down switching regulator with integrated high-side/low-side, high-voltage power MOSFETs. It provides a highly efficient output of up to 0.3A.

The wide 4.5V to 75V input range accommodates a variety of step-down applications in automotive environment. A 5 $\mu$ A shutdown mode quiescent current in full temperature range is good for battery-powered applications.

It allows for high power conversion efficiency over a wide load range by scaling down the switching frequency under light-load condition to reduce the switching and gate driver losses.

The EV4569-N-00A is assembled and tested with SOIC-8 EP package.

## ELECTRICAL SPECIFICATIONS

Parameter	Symbol	Value	Units
Input Voltage	$V_{IN}$	4.5-75	V
Output Voltage	$V_{OUT}$	3.3	V
Output Current	$I_{OUT}$	0.3	A

## FEATURES

- 20 $\mu$ A Quiescent Current (Active mode)
- Wide 4.5V to 75V Operating Input Range
- Programmable Soft-Start
- FB-Tolerance: 1% at Room Temperature; 2% at Full Temperature.
- Adjustable Output
- Low Shutdown Mode Current: 5 $\mu$ A
- Available in AEC-Q100 Grade 1
- Fully Assembled and Tested

## APPLICATIONS

- Automotive Systems
- Industrial Power Systems
- Distributed Power Systems
- Battery Powered Systems

All MPS parts are lead-free and adhere to the RoHS directive. For MPS green status, please visit MPS website under Products, Quality Assurance page.

## EVB TEST RESULTS

$V_{IN} = 12V$ ,  $V_{OUT} = 3.3V$ ,  $L = 33\mu H$ ,  $C_{OUT} = 2 \times 22\mu F$ ,  $T_A = +25^\circ C$ , unless otherwise noted.

**EVB TEST RESULTS** *(continued)*
 $V_{IN} = 12V$ ,  $V_{OUT} = 3.3V$ ,  $L = 33\mu H$ ,  $C_{OUT} = 2 \times 22\mu F$ ,  $T_A = +25^\circ C$ , unless otherwise noted.

## QUICK START GUIDE

1. Connect the positive and negative terminals of the load to the VOUT and GND pins respectively.
2. Preset the power supply output to between 4.5V to 75V and then turn it off.
3. Connect the positive and negative terminals of the power supply output to the VIN and GND pins respectively.
4. Turn the power supply on. The MPQ4569GN will automatically startup.
5. To use the Enable function, apply a digital input to the EN pin. Drive EN higher than 1.55V to turn on the regulator, drive EN less than 1.2V to turn it off. Float this pin to shut the chip down.
6. Internally a zener diode is connected from EN pin to GND pin. The typical clamping voltage of the zener diode is 6.5V. So VIN can be connected to EN through a high ohm resistor if the system doesn't have any other logic input acting as enable signal. The resistor needs to be designed to limit the EN pin sink current less than 150 $\mu$ A. Just note that there is an internal 3M resistor from EN to GND, so the external pull up resistor should be smaller than  $\frac{[V_{IN(MIN)} - 1.55V] \times 3M}{1.55V}$  to make sure the part can EN on at the lowest operation VIN.
7. Use R7 and R5 to set the output voltage with  $V_{FB}=1V$ . For  $R7=1.2M\Omega$ , R5 can be determined by:

$$R5 = \frac{1.2}{V_{OUT} - 1} M\Omega$$

Follow the Application Information section in the device datasheet to recalculate the inductor and output capacitor values when output voltage is changed.
