

EV6540H-U-00A

6A, 50V Three-Phase BLDC Motor Driver Evaluation Board

DESCRIPTION

The EV6540H-U-00A is an evaluation board for the MP6540HGU, a three-phase BLDC motor driver.

It operates from a supply voltage of up to 50V. It integrates three half-bridges consisting of 6 N-channel Power MOSFETs. The rotor position information is provided by the Hall sensors assembled in the motor and the driving control signals are generated by the external controller, such as MCU, FPGA, etc.

QUICK START GUIDE

1. Attach the input voltage ($5.5V \leq V_{IN} \leq 50V$) and input ground to the VIN and GND connectors respectively.
2. Attach a 3.3V or 5V constant voltage to the 3P3 connector and switch the SW1 to the position 1(right side) to enable the chip.
3. Attach a 3.3V or 5V constant voltage to the VREF connector to set the current sense output reference voltage.
4. Attach the hall signals coming from the motor to the Hall Sensor connector.
5. Attach the driving control signals generated by the external controller to the CN2 connector.
