

### DESCRIPTION

The MP6401 combines a low-dropout linear regulator with an integrated reset circuit. It operates from a 2.5V to 5.5V input voltage and regulates the output voltage with 2% accuracy at 1.8V, 2.5V, 3.3V or adjustable value. It delivers up to 300mA of load current. By combining an LDO linear regulator with a reset circuit, these products can reduce cost and save space in compact portable devices such as cell phones, smart phones, PDAs, PMPs, and portable GPS devices.

The MP6401 provides a push-pull, active-low that asserts when the regulator output voltage drops below the microprocessor supply threshold (-7.5% or -12.5% of nominal output voltage). Four reset delay time, 3.125ms, 25ms, 200ms and 1580ms can be selected. The MP6401 is available in 3mmx3mm TQFN8, 2mmx2mm TQFN6 and TSOT packages and is specified for operation from -40°C to 85°C.

### FEATURES

- Low Quiescent Current of 80µA for Battery Powered Equipment
- Low 114mV Dropout at 300mA Output
- ±2% Accurate Output Voltage
- Fixed Output Voltage Options of 1.8V, 2.5V or 3.3V
- Adjustable Output Voltage from 1.229V to 5V Using an External Resistor Divider
- 15µV<sub>RMS</sub> Ultra Low Noise Output
- PSRR: 57dB at 1kHz
- Input Reverse Current, Thermal and Short-Circuit Protection
- Microprocessor Reset with Four Delay time Options
- Push-Pull  $\overline{\text{RESET}}$

### APPLICATIONS

- Smart Phone and Cell Phone
- Portable GPS Devices
- Wireless Devices
- PDA and PMP

All MPS parts are lead-free and adhere to the RoHS directive. For MPS green status, please visit MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

#### ABSOLUTE MAXIMUM RATINGS <sup>(1)</sup>

IN, EN, OUT .....	-0.3V to + 6 V
ADJ .....	-0.3V to 6V
RESET .....	-0.3V to 6V
Continuous Power Dissipation. (T <sub>A</sub> = +25°C) <sup>(2)</sup>	
TQFN8 (3mm x 3mm) .....	2.6W
TQFN6 (2mm x 2mm) .....	1.56W
TSOT .....	0.57W
Junction Temperature .....	150°C
Lead Temperature .....	260°C
Storage Temperature .....	-65°C to +150°C

#### Recommended Operating Conditions <sup>(3)</sup>

Supply Voltage V <sub>IN</sub> .....	2.5V to 5.5V
Operating Junct. Temp (T <sub>J</sub> ) .....	-40°C to +125°C

#### Thermal Resistance <sup>(4)</sup>

	$\theta_{JA}$	$\theta_{JC}$
TQFN8 (3mm x 3mm) .....	48	11 ... °C/W
TQFN6 (2mm x 2mm) .....	80	16 ... °C/W
TSOT .....	220	110 .. °C/W

#### Notes:

- Exceeding these ratings may damage the device.
- The maximum allowable power dissipation is a function of the maximum junction temperature T<sub>J</sub> (MAX), the junction-to-ambient thermal resistance  $\theta_{JA}$ , and the ambient temperature T<sub>A</sub>. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P<sub>D</sub> (MAX) = (T<sub>J</sub> (MAX)-T<sub>A</sub>)/ $\theta_{JA}$ . Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage. Thermal shutdown engages at T<sub>J</sub>=150°C(TYP) and disengages at T<sub>J</sub>=130°C(TYP)
- The device is not guaranteed to function outside of its operating conditions.
- Measured on JESD51-7 4-layer board.

## ELECTRICAL CHARACTERISTICS

$V_{IN} = (V_{OUT} + 0.5V)$  or  $+2.5V$ , whichever is greater,  $C_{OUT} = 3.3\mu F$ . Typical Value at  $T_A = +25^\circ C$  unless otherwise noted.

Parameter	Symbol	Condition	Min	Typ	Max	Unit
Input Supply Range	$V_{IN}$		2.5		5.5	V

**ELECTRICAL CHARACTERISTICS** *(continued)*

$V_{IN} = (V_{OUT} + 0.5V)$  or  $+2.5V$ , whichever is greater,  $C_{OUT} = 3.3\mu F$ . Typical Value at  $T_A = +25^\circ C$  unless otherwise noted.

Parameter	Symbol	Condition	Min	Typ	Max	Unit
RESET Output Voltage Push-Pull	$V_{OL}$	$V_{OUT} \geq 1.0V$ , $I_{SINK} = 50\mu A$ , RESET asserted			0.3	V
		$V_{OUT} \geq 1.5V$ , $I_{SINK} = 3.2mA$ , RESET asserted			0.4	
	$V_{OH}$	$V_{OUT} \geq 2.0V$ , $I_{SOURCE} = 500\mu A$ , RESET deasserted	$0.8V_{OUT}$			

**Notes:**

5) Dropout Voltage is defined as the input to output differential when the output voltage drops 100mV below its nominal value.

## PIN FUNCTIONS

TQFN8 Pin #	TQFN6 Pin#	TSOT Pin#	Name	Description
1	1	3	IN	Supply input pin.
2				
3	2	2	GND	Ground.
4	3	1	EN	Enable (Active High). Connect EN to IN generally. Don't float EN pin.
5	4	6	$\overline{\text{RESET}}$	Push-pull $\overline{\text{RESET}}$ . It asserts when the OUT voltage drops below its threshold. When OUT voltage recover, $\overline{\text{RESET}}$ deasserts after a fix delay time (four options).
6	5	5	ADJ	Mode selector input. When ADJ is connected to the tap of an external resistor divider from the OUT to GND, the OUT voltage is adjustable. When ADJ is connected to GND, a preset output voltage is selected.
7	6	4	OUT	Regulator output pin.
8				

## TYPICAL PERFORMANCE CHARACTERISTICS

$V_{IN}=5V$ ,  $V_{OUT}=3.3V$ ,  $C_{OUT}=3.3\mu F$ ,  $T_A=-40^{\circ}C$  to  $+85^{\circ}C$ , Typical values are at  $T_A=+25^{\circ}C$ , unless otherwise noted.

**TYPICAL PERFORMANCE CHARACTERISTICS (continued)**

$V_{IN}=5V$ ,  $V_{OUT}=3.3V$ ,  $C_{OUT}=3.3\mu F$ ,  $T_A=-40^{\circ}C$  to  $+85^{\circ}C$ , Typical values are at  $T_A=+25^{\circ}C$ , unless otherwise noted.

**Start-up through  $V_{IN}$** 

$V_{IN} = 3.8V, I_{OUT} = 0$

**Load-Transient Response**

## OPERATION

The MP6401 integrates a low noise, low dropout, low quiescent current linear regulator and a microprocessor reset circuit. It operates from a 2.5V to 5.5V input voltage and regulates the fixed output voltage with 2% accuracy at 1.8V, 2.5V, 3.3V or adjustable value. The MP6401 can supply to 300mA of load current. The internal reset circuit is used to monitor the regulator output voltage. The  $\overline{\text{RESET}}$  asserts when the regulator output voltage drops below the standard microprocessor supply threshold.

### Linear Regulator

The MP6401 can output a fixed voltage (1.8V, 2.5V, 3.3V options) or adjustable voltage which ranges from 1.25V to 5V with 2.0% accuracy by operating from a +2.5V to +5.5V input. The MP6401 can supply up to 300mA of load current. When ADJ is connected to GND, a fixed output voltage is selected. Connecting ADJ pin to the tap of external resistor divider from the OUT to GND, adjustable output voltage is selected. The typical ADJ connection is shown in Fig 3.

**Figure 3—Output Voltage Adjusted with Resistor Divider**

### Reset Function

The reset circuit monitors the OUT voltage.  $\overline{\text{RESET}}$  asserts while OUT voltage falls below its threshold. Two OUT voltage thresholds (-7.5% and -12.5%) are available. The power-up, power-down, and brownout conditions will make  $\overline{\text{RESET}}$  asserted. So MP6401 monitor circuit could right control the microprocessor.  $\overline{\text{RESET}}$  asserts when the input and output voltage below their thresholds.  $\overline{\text{RESET}}$  asserts when EN is a low logic. When the assert trigger condition is removed,  $\overline{\text{RESET}}$  will deassert after a fixed delay time. Four options of reset delay-time (see Table 3) can be selected.

### EN Shutdown

The MP6401 can be switched ON or OFF by a logic input at the EN pin. A high voltage at this pin will turn the device on. When the EN pin is low, the regulator output is off and the supply current is reduced. Generally, the EN pin should be tied to IN to keep the regulator output always on. Do not float the EN pin.

### Reverse Leakage Protection

An internal circuit monitors  $V_{\text{IN}}$  and  $V_{\text{OUT}}$  to control the reverse leakage current from OUT to IN. While  $V_{\text{IN}}$  decreases lower than  $V_{\text{OUT}}$  and EN still hold logic high, the monitor circuit turns off the pass element and its parasitic diode. Typically the reverse leakage current through pass element decreases to 0.1uA.  $\overline{\text{RESET}}$  deasserts until  $V_{\text{IN}}$  returns greater than  $V_{\text{OUT}}$  and  $V_{\text{OUT}}$  is higher than its preset threshold.

MP6401 also can work with backup battery at OUT after input power supply is removed as shown in Fig 4. When input power supply is removed,  $\overline{\text{RESET}}$  asserts. The backup battery will power the device through two external diodes and typically the current from OUT to ground is 40uA. So, the power supply removing does not erase RAM content if the voltage of backup battery is greater than memory's standby specification. The backup battery can be replaced by a super-cap, while the diode connected with battery is changed to a current-limiting resistor.

**Figure 4— Maintain Memory with Backup Battery**

### Current Limit

The MP6401 includes a current limit structure which monitors and controls pass element gate voltage limiting the guaranteed maximum output current to 500mA.

**Thermal Shutdown**

Thermal protection turns off the pass element when the junction temperature exceeds +150°C, allowing to cool the IC. When the IC's junction temperature drops by 20°C, the pass element will be turned on again. Thermal protection limits total power dissipation on the MP6401. For reliable operation, junction temperature should be limited to 125 °C maximum.

## APPLICATION INFORMATION

### Adjustable Regulator Output

The OUT voltage of MP6401 has two modes available (fixed and adjustable output voltage). When ADJ pin is connected to GND, the regulator works in fixed voltage mode. The regulator output voltage will equal to preset voltage (1.8V, 2.5V or 3.3V options). In fixed voltage mode, the impedance between ADJ and ground should always be less than 50kΩ. Generally, ADJ is connected directly to ground.

When the ADJ pin is connected to the tap of an external resistor divider, the regulator works in adjustable voltage mode as shown in Fig 3. The output voltage is selected by resistor divider, thus

$$V_{OUT} = 1.229 \times \frac{R_1 + R_2}{R_2}$$

In adjustable voltage mode, R<sub>2</sub> equal to 13kΩ is recommended as a good tradeoff among stability, accuracy and high-frequency PSRR. R<sub>2</sub> should be not greater than 100kΩ.

### Power Dissipation

The power dissipation for any package depends on the thermal resistance of the case and circuit board, the temperature difference between the junction and ambient air, and the rate of airflow. The power dissipation across the device can be represented by the equation:

$$P = (V_{IN} - V_{OUT}) \times I_{OUT}$$

The allowable power dissipation can be calculated using the following equation:

$$P_D (MAX) = (T_J (MAX) - T_A) / \theta_{JA}$$

Where (T<sub>J</sub>(MAX)-T<sub>A</sub>) is the temperature difference between the junction and the ambient environment, θ<sub>JA</sub> is the thermal resistance from the junction to the ambient environment. Connecting the GND pin of MP6401 to ground using a large pad or ground plane helps to channel heat away.

### Output Capacitor Selection

The MP6401 is designed specifically to work with very low ESR ceramic output capacitor 3.3uF (min). For performance consideration, a large ceramic capacitor such as 10uF is better. X7R or X5R capacitor dielectric is recommended.

### OUT Voltage Transient Immunity

The MP6401 can be immune to OUT pin short negative transient. Typically, the immune duration is 60us with 10mV overdriving. A shorter negative transient can not make the  $\overline{RESET}$  output assert.
