

DESCRIPTION

The MP1925 is a high-frequency, half-bridge, N-channel power MOSFET driver. Its low-side and high-side driver channels are controlled independently and matched with less than 5ns of time delay. Under-voltage lockout (UVLO) on both the high-side and low-side supplies forces the outputs low in the event that the supply is insufficient. The integrated bootstrap diode reduces the external component count.

The MP1925 is available in a QFN-8 (4mmx4mm) package.

FEATURES

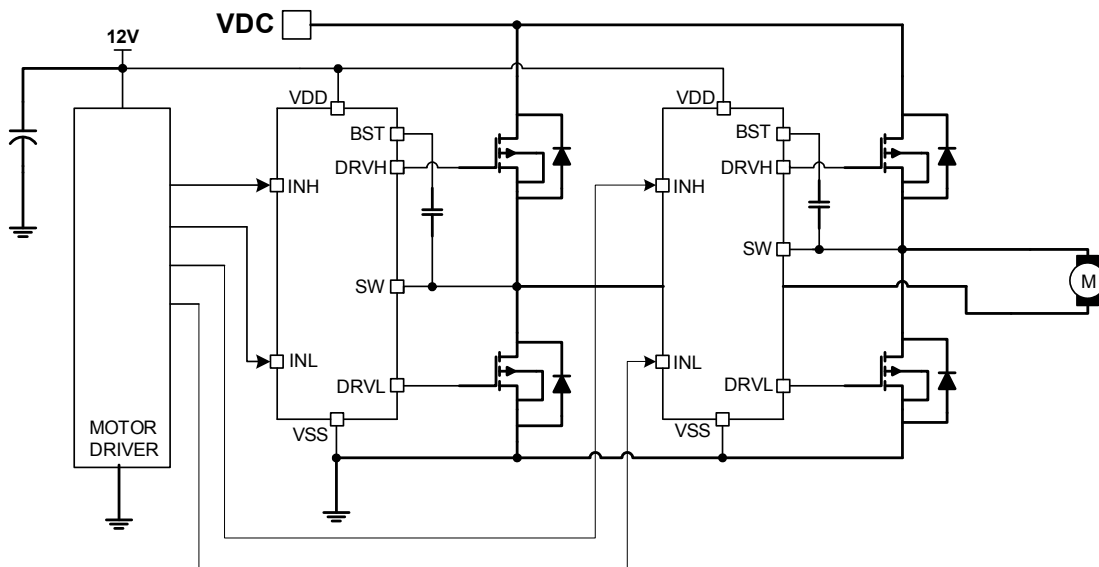

- Drives an N-Channel MOSFET Half-Bridge
- 115V Bootstrap Voltage Range
- On-Chip Bootstrap Diode
- Typical Propagation Delay of 20ns
- Gate Driver Matching of Less than 5ns
- Drives a 2.2nF Load with 15ns of Rise Time and 10ns of Fall Time at 12V VDD
- TTL-Compatible Input
- Quiescent Current of Less than 150µA
- UVLO for Both High-Side and Low-Side Gate Drivers
- Available in a QFN-8 (4mmx4mm) Package

APPLICATIONS

- Motor Drivers
- Telecom Half-Bridge Power Supplies
- Avionics DC/DC Converters
- Two-Switch Forward Converters
- Active Clamp Forward Converters

All MPS parts are lead-free, halogen-free, and adhere to the RoHS directive. For MPS green status, please visit the MPS website under Quality Assurance. "MPS", the MPS logo, and "Simple, Easy Solutions" are trademarks of Monolithic Power Systems, Inc. or its subsidiaries.

ORDERING INFORMATION

Part Number*	Package	Top Marking
MP1925HR	QFN-8 (4mmx4mm)	See Below

* For Tape & Reel, add suffix -Z (e.g. MP1925HR-Z)
 For RoHS compliant packaging, add suffix -LF (e.g. MP1925HR-LF-Z)

TOP MARKING

MPSYWW
MP1925
LLLLLL

MPS: MPS prefix
 Y: Year code
 WW: Week code
 MP1925: Part number
 LLLLLL: Lot number

PACKAGE REFERENCE

PIN FUNCTIONS

Pin #	Name	Description
1	VDD	Supply input. VDD supplies power to the internal circuitry. Place a decoupling capacitor to ground close to VDD to ensure a stable and clean supply.
2	BST	Bootstrap. BST is the positive power supply for the internal floating high-side MOSFET driver. Connect a bypass capacitor between BST and SW.
3	DRVH	Floating driver output.
4	SW	Switching node.
5	INH	Control signal input for the floating driver.
6	INL	Control signal input for the low-side driver.
7	VSS, exposed pad	Chip ground. Connect the exposed pad to VSS for proper thermal operation.
8	DRVL	Low-side driver output.

ABSOLUTE MAXIMUM RATINGS ⁽¹⁾

Supply voltage (V_{DD})	-0.3V to +18V
SW voltage (V_{SW})	-5.0V to +105V
SW voltage (V_{SW})	-25V(<100ns) to +105V
BST voltage (V_{BST})	-0.3V to +115V
BST voltage (V_{BST})	-15V(<100ns) to +115V
BST to SW	-0.3V to +18V
DRVH to SW ⁽²⁾	-0.3V to 18.3V
DRVH to SW ⁽²⁾	-5V(<100ns) to 18.3V
DRVH to VSS	-0.3V to (BST - SW) + 0.3V
DRVH to VSS	-15V (<100ns) to (BST-VSS)+0.3V
DRVL to VSS ⁽²⁾	-0.3V to 18.3V
DRVL to VSS ⁽²⁾	-5V(<100ns) to 18.3V
INH/NL to VSS	-0.3V to (V_{DD} + 0.3V)
INH/INL to VSS	-5V(<100ns) to (V_{DD} + 0.3V)
All other pins	-0.3V to (V_{DD} + 0.3V)
Continuous power dissipation ($T_A = 25^\circ\text{C}$) ⁽³⁾	
QFN-8 (4mmx4mm)	2.66W
Junction temperature	150°C
Lead temperature	260°C
Storage temperature	-65°C to +150°C

Recommended Operating Conditions ⁽⁴⁾

Supply voltage (V_{DD})	8.0V to 15.0V
SW voltage (V_{SW})	-1.0V to +100V
SW slew rate	<50V/ns
Operating junction temp ($T_J = T_A$)	
	-40°C to +125°C

Thermal Resistance ⁽⁵⁾	θ_{JA}	θ_{JC}
QFN-8 (4mmx4mm)	47	7
	°C/W	

Notes:

- 1) Exceeding these ratings may damage the device. The repetitive pulse rating is guaranteed for period of 100ns or less with a maximum repetition rate of 1000kHz when VDD is 15V or less.
- 2) DRVH and DRVL are outputs pins, cannot be connected to external supply voltage.
- 3) The maximum allowable power dissipation is a function of the maximum junction temperature T_J (MAX), the junction-to-ambient thermal resistance θ_{JA} , and the ambient temperature T_A . The maximum allowable continuous power dissipation at any ambient temperature is calculated by P_D (MAX) = $(T_J$ (MAX) - T_A) / θ_{JA} . Exceeding the maximum allowable power dissipation produces an excessive die temperature, causing the regulator to go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- 4) The device is not guaranteed to function outside of its operating conditions.
- 5) Measured on JESD51-7, 4-layer PCB.

ELECTRICAL CHARACTERISTICS

$V_{DD} = V_{BST} - V_{SW} = 12V$, $V_{SS} = V_{SW} = 0V$, no load at DRVH and DRVL, $T_J = -40^{\circ}C$ to $+125^{\circ}C$, typical value is tested at $T_J = 25^{\circ}C$, unless otherwise noted.

Parameter	Symbol	Condition	Min	Typ	Max	Units
Supply Currents						
VDD quiescent current	I_{DDQ}	INL = INH = 0		110	150	μA
VDD operating current	I_{DDO}	$f_{SW} = 500kHz$		9		mA
Floating driver quiescent current	I_{BSTQ}	INL = INH = 0		60	90	μA
Floating driver operating current	I_{BSTO}	$f_{SW} = 500kHz$		8		mA
Leakage current	I_{LK}	BST = SW = 100V		0.05	1	μA
Inputs						
INL/INH high				2	2.4	V
INL/INH low			1	1.4		V

APPLICATION INFORMATION

The input signals of INH and INL can be controlled independently. If both INH and INL control the high-side and low-side MOSFETs of the same bridge, set a sufficient dead time

between INH and INL low (and vice versa) to avoid shoot-through (see Figure 3). Dead time is defined as the time interval between INH low and INL low.

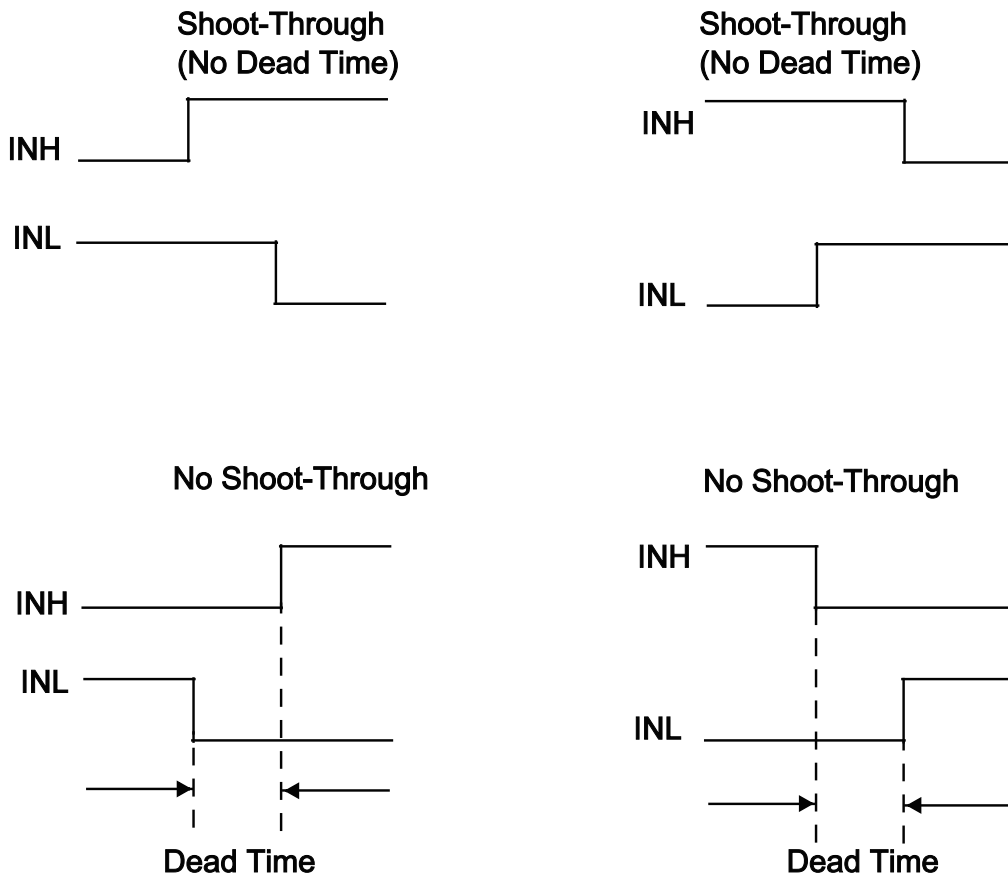

Figure 3: Shoot-Through Timing Diagram

REFERENCE DESIGN CIRCUITS

Half-Bridge Converter

The MP1925 drives the MOSFETS via alternating signals with dead time in half-bridge converter topology. The input voltage can rise up

to 100V with the alternating signals (INH and INL) coming from the PWM controller (see Figure 4).

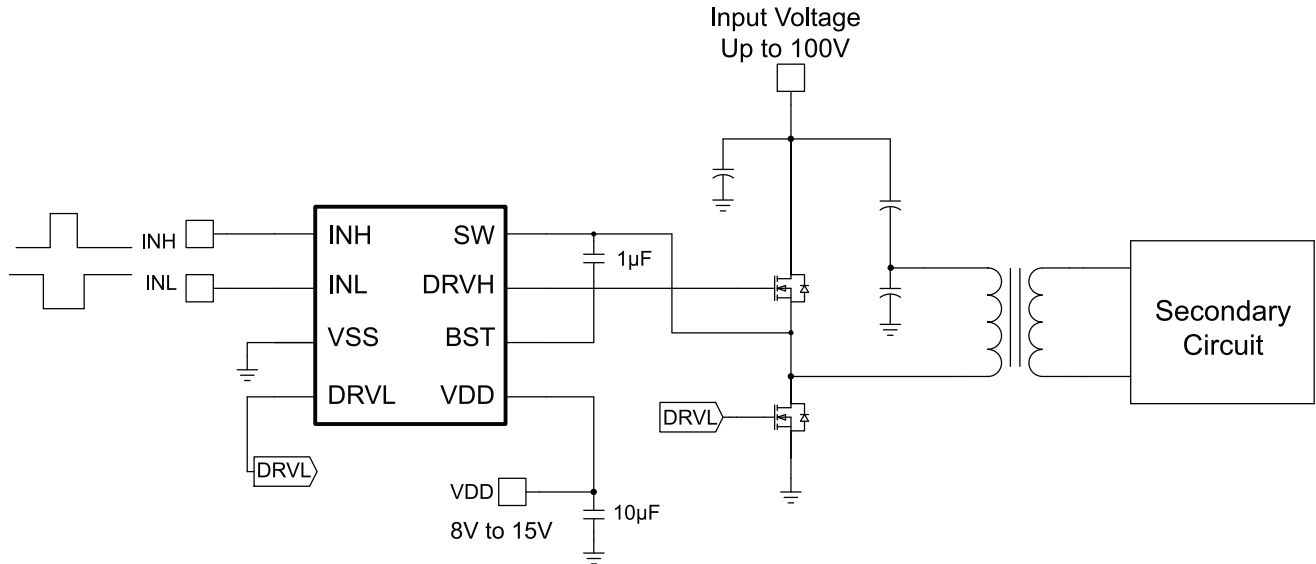

Figure 4: Half-Bridge Converter

Two-Switch Forward Converter

In two-switch forward converter topology, both MOSFETs turn on and off simultaneously. The input signals (INH and INL) come from a PWM controller that senses the output voltage and output current during current mode control.

The Schottky diodes clamp the reverse swing of the power transformer, and must be rated for the input voltage. The input voltage can rise up to 100V (see Figure 5).

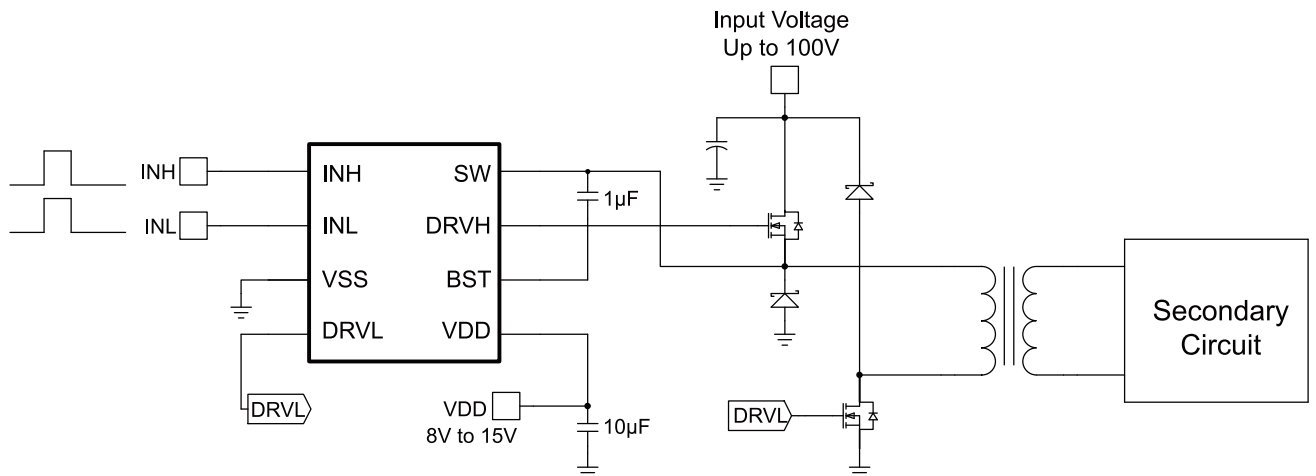

Figure 5: Two-Switch Forward Converter

Active Clamp Forward Converter

In active clamp forward converter topology, the MP1925 drives the MOSFETs with alternating signals. The high-side MOSFET, in conjunction with C_{reset} , is used to reset the power transformer without loss.

This topology is optimal for running at duty cycles exceeding 50%. The device may not be able to run at 100V in this topology (see Figure 6).

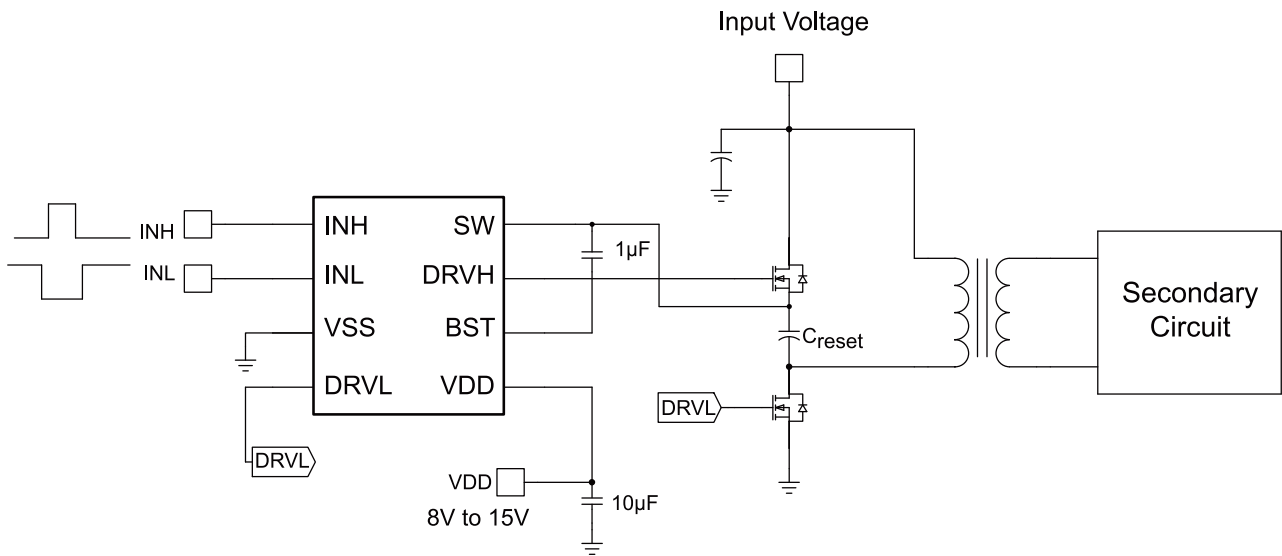

Figure 6: Active Clamp Forward Converter
