# MP3214

## 500mA LED Camera Flash Charge Pump

### DESCRIPTION

The MP3214 is a low noise, high current charge pump designed to drive LEDs at up to 500mA with an input supply of 2.7 to 5.5 volts. The high efficiency and low external parts count (two small bypass caps, two small charge pump caps, and one programming resistor) make the MP3214 ideally suited for portable applications where small size and high efficiency are critical.

The MP3214 controls the inrush current via a soft start algorithm. High frequency switching of the charge pump capacitors allows for very small capacitance values.

The output current is set by an external resistor,  $R_{SET}$ . The brightness of the LED can be modulated by a PWM on the enable pin.

The MP3214 automatically adjusts the switching mode of the charge pump for optimal efficiency.

The MP3214 is available in a 16 pin 3x3mm QFN package.

### FEATURES

- High Efficiency
- Up to 500mA Output Current
- Wide Supply Range of 2.7V to 5.5 V
- Small Solution Size
- Soft Start
- Low Shutdown Current
- Open/Short Led Protection
- No Inductors
- Programmable Output Current
- PWM Brightness Control

### APPLICATIONS

- LED Backlight
- LED Flash
- LED Torch/Flashlight
- Cell Phones, Cameras, PDA, and Handheld Equipment

For MPS green status, please visit MPS website under Quality Assurance. "MPS" and "The Future of Analog IC Technology" are Registered Trademarks of Monolithic Power Systems, Inc.

### TYPICAL APPLICATION

## ORDERING INFORMATION

Part Number*	Package	Top Marking	Free Air Temperature (T <sub>A</sub> )
MP3214DQ	QFN16 (3 x 3mm)	2F	-40°C to +85°C

\* For Tape & Reel, add suffix -Z (g. MP3214DQ-Z).

For RoHS compliant packaging, add suffix -LF (e.g. MP3214DQ-LF-Z)

## PACKAGE REFERENCE

### ABSOLUTE MAXIMUM RATINGS <sup>(1)</sup>

All Other Pins .....	-0.3V to +6.5V
Continuous Power Dissipation (T <sub>A</sub> = +25°C) <sup>(2)</sup>	2.1W
Junction Temperature .....	150°C
Lead Temperature .....	260°C
Storage Temperature .....	-65°C to +150°C
Supply Voltage V <sub>IN</sub> .....	2.5V to 6V

### Recommended Operating Conditions <sup>(2)</sup>

Supply Voltage V <sub>IN</sub> .....	2.7V to 5.5V
Maximum Junction Temp. (T <sub>J</sub> ) .....	+125°C

<b>Thermal Resistance <sup>(3)</sup></b>	<b>θ<sub>JA</sub></b>	<b>θ<sub>JC</sub></b>
QFN16 (3 x 3mm) .....	60	12 ... °C/W

#### Notes:

- 1) Exceeding these ratings may damage the device.
- 2) The maximum allowable power dissipation is a function of the maximum junction temperature T<sub>J</sub> (MAX), the junction-to-ambient thermal resistance θ<sub>JA</sub>, and the ambient temperature T<sub>A</sub>. The maximum allowable continuous power dissipation at any ambient temperature is calculated by P<sub>D</sub> (MAX) = (T<sub>J</sub> (MAX)-T<sub>A</sub>)/θ<sub>JA</sub>. Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown. Internal thermal shutdown circuitry protects the device from permanent damage.
- 3) The device is not guaranteed to function outside of its operating conditions.
- 4) Measured on JESD51-7, 4-layer PCB.

## ELECTRICAL CHARACTERISTICS

$V_{BATT} = 3.6V$ ,  $C1=C2=2.2\mu F$ ,  $C_{OUT}=4.7\mu F$ ,  $C_{BYPASS}=1\mu F$ ,  $T_A = +25^\circ C$ , unless otherwise noted.

Parameter	Symbol	Condition	Min	Typ	Max	Units
Input Supply Voltage	$V_{IN}$		2.7		5.5	V
Supply Current	$I_{IN}$			3		mA
Shutdown Current	$I_{SHUTDOWN}$			0.1		$\mu A$
$I_{LED}$ Drop Out Voltage				0.3		V
LED Current Turn On Delay				4		$\mu s$
Clock Frequency				1.35		MHz
En Threshold High				0.81		V
En Threshold Low				0.75		V
$I_{OUT}$ Gain Accuracy		$I_{OUT}$ Measured with $R_{SET}=17.8k$	186	202	218	mA
Gain Coefficient		$I_{OUT} = Gain/R_{SET}$	-8%	3600	+8%	V
Thermal Shutdown				150		$^\circ C$

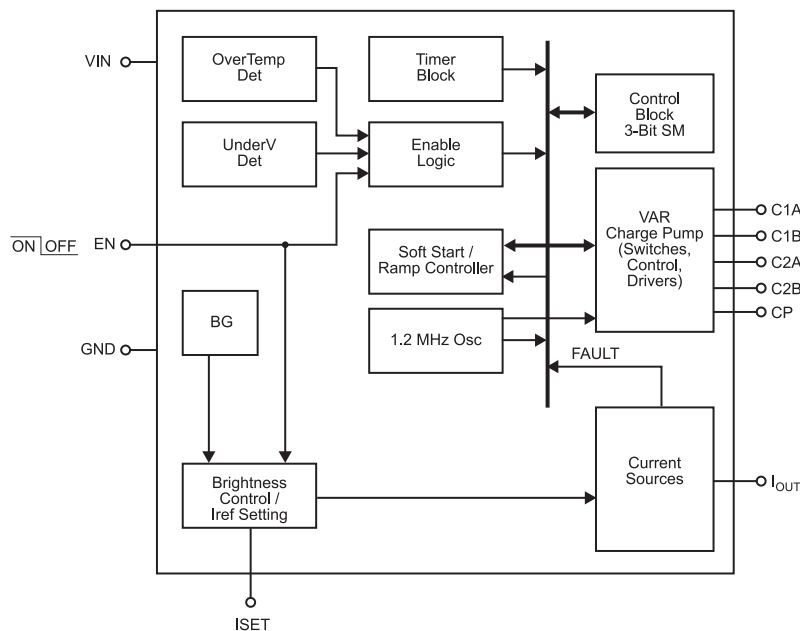

**Note:**

- 5) Current matching definition:  $(Max - Min)/(Max + Min)$
- 6) Guaranteed by design.

## PIN FUNCTIONS

Pin #	Name	Description
1	CP	Charge pump bypass for common anode version. Connect a 2.2 $\mu$ F bypass capacitor to GND.
2	C2B	Charge Pump Capacitor #2 Negative Node. Connect the negative side of the #2 charge pump capacitor to C2B.
3	C1B	Charge Pump Capacitor #1 Negative Node. Connect the negative side of the #1 charge pump capacitor to C1B.
4	C1A	Charge Pump Capacitor #1 Positive Node. Connect the positive side of the #1 charge pump capacitor to C1A. Typical applications require C1 to be 1 $\mu$ F.
5,9	GND	Battery Power Ground. Connect the exposed pad to this pin.
6	C2A	Charge Pump Capacitor #2 Positive Node. Connect the positive side of the #2 charge pump capacitor to C2A. Typical applications require C2 to be 1 $\mu$ F.
7	VIN	Battery Power Input. Connect the 2.5V to 5.5V input source between BATT and GND. Bypass BATT to GND with a 2.2 $\mu$ F or greater capacitor.
8	EN	Enable input.
10	TOE	Time Out Enable. With TOE=1 the time out is enabled. The device will keep operating for a period of time after the EN pin goes low.
11	ISET	Current Control Input. Connect a resistor between ISET and GND to set the LED current up to 500mA.
12,13,16	NC	No connection.
14,15	IOUT	Driver for Flashlight. Connect the flashlight LED between this pin and BATT, with the anode at BATT.

## OPERATION

### Using the Enable Pin to PWM the LED Current

The Enable (En) pin can enable (logic 1) or disable (logic 0) the part. When disabled, the part enters a low current sleep mode.

There is an internal one shot on the enable pin. The enable pin must go low for more than 30mS in order to completely disable the part and enter the low current shutdown mode. Although the part internally does not immediately shut off, the output drive to the LED does immediately turn off.

A low frequency PWM on the enable pin (50Hz to 2kHz) can be used to change the LED brightness. For example, if a 20% duty cycle PWM signal is applied to the enable pin, the average output current is 20% the full current.

### Setting the Output Current

The output current is set by the resistor  $R_{SET}$ .  $R_{SET}$  is connected from the  $I_{SET}$  pin to ground. The output current follows the equation:

$$I_{OUT} = \frac{3570}{R_{SET}}$$

or for a desired  $I_{OUT}$ ,  $R_{SET}$  is calculated by:

$$R_{SET} = \frac{3570}{I_{OUT}}$$

For example:

$R_{SET}$	$I_{OUT}$
7140Ω	500mA
8925Ω	400mA
11900Ω	300mA
17850Ω	200mA
35700Ω	100mA

### Charge Pump Operation

Normal battery operation will supply a voltage that is initially high (roughly 4.2volts when fully charge) falling to a mid voltage for much of it's life ( roughly 3 to 3.6 volts) and finally dropping to a low voltage (roughly 2.7 to 3.0 volts) when fully discharged. At the high end of the battery voltage, the LED can be driven directly from the battery to ground. As the battery discharges, the voltage must be boosted to allow enough forward voltage to turn on the LED. On the MP3214, the boost voltage pushes the charge pump output (CP) below ground to gain the required headroom.

The charge pump gain can be changed on the fly to optimize the charge pump voltage for maximum efficiency. The gain can be configured to be 1, 1.5 or 2. The charge pump gain control is accomplished automatically by an internal feedback network.

### Time Out Enable

The TOE function acts to extend the device operation, for a period of time, after the enabled pin goes low. With TOE=1 the time out is enabled. When the enable pin goes high, the part turns on as in normal operation. When the enable pin goes low, the part and the output, remain on for an extra 1.55 seconds.

When TOE=0, the enabled pin functions directly bases on the logic level of the input. The part turns on when enable is high, and off when enable is low.
